Rising in the background you will also hear the murmured mumblings of the QRP crowd extolling the nobility of "5 watts or less" and the great skills learned from piss-weak transmitters, especially when used in a basement apartment with a kids slinky-toy or other makeshift antenna. I got a hot flash for them -- it takes no more skill or effort to key a 1milliwatt transmitter than it does to key a 1kilowatt transmitter. The real skill and effort is displayed by those who pull your whisper-thin signals out of the atmospheric noise.

With all kind regards,

de Hans, K0HB

Dick apparently doesn't realize that RTTY and PSK31 share a common problem which is easily corrected with forward error correction as is done in PACTOR I & II. RTTY and PSK31 are not the best choices for emergency communications but PACTOR I & II are very good choices.

> Seems to me that this shows that NOT being
> a part of emergency PREPARATION creates such
> an uninformed statement.

"The Institute", a monthly publication of the IEEE has an article titled, "IEEE Standard Assists Emergency Response Teams". It says, "When fully deployed, the IEEE Standard for Common Incident Management Message Sets for Use by Emergency Management Centers (IEEE Std 1512-2000) will become a major component of the country's Intelligent Transportation System (ITS)." Any hams working on that standard?

Of course not.

Do you know what the proposed changes of 1975 were?

> >Did it go to EVERY licensed ham?
> >(NOTE - You actually answered this below)

It went to all US ARRL members. Dig out your 1975 QSTs and see what
was going on.

> I do not think that governenace by poll is the best way to make decisions. I

Any system that allows everyone to express an opinion is going to have
a certain amount of "noise" from folks who don't know what they are
talking about. The comment system is just as open to such things.
>
> IMHO, the process that the FCC uses right now, with a rulemaking process in

Ah - but WHO decides who is "knowledgeable" and who isn't? And by what
standard is a person's knowledge judged?

By the "knowledgeable" philosophy, only "knowledgeable" people should
be allowed to vote in elections.

Want to bet that we'll see some changes in ARRL directors as a direct result of that one particular shift in position?

Is it also a significant problem facing the photonics industry? All sorts
of people talk about CW lasers. They are often modulated by various means.

What kind of "RTTY"? Baudot, ASCII, or some other type? What speed? What shift? Can received text be stored or printed somehow, or must one write it down manually? Will it send as well as receive when a keyboard is added?

One of the biggest problems of the "keyboard modes" is that there are so many of them.

Never heard of him but I will look him up. Thanks, Hans.

--

And now, for an added bit of surrealism, I bring you:

"The Movie Game"

The Movie Game is an exercise in imagination. In the Game, you imagine
that you are casting a movie or miniseries to be made from a book or a
life situation, then decide what actors you would cast in the various
roles. You are not limited to the current crop of actors - you can
pick actors from the past, at any time of their careers. You can do
Hollywood-style makeovers like changing hair color and disguising
height differences. End result of the Game is a cast of characters.

The most common forms of the Game are to imagine making books into movies and life-situations such as one's co-workers or immediate family into a movie or TV series. The Gane can also be played in reverse, where you cast people you know into various roles.

For example, suppose a miniseries were to be made of "Atlas". Who would play Dagny Taggart? Katharine Hepburn at about age 30-35 would be one choice. Meryl Streep is another obvious one. Hank Rearden? Harrison Ford, of course.

Ayn Rand herself had a particular favorite back in the early '80s (see spoiler below).

Or suppose a film were to be made of rrap - who would be cast as the various characters?

73 de Jim, N2EY

spoiler follows

SPOILER!!!!

Ayn Rand wanted Farrah Fawcett to play Dagny Taggart. Absolute fact.

Would you be counting W4ASX among these "over-audioed" abusers? That man is absolutely fixated on his audio and rarely talks about anything else and he does not give one hoot that his signal is wiiiiiiiide!

>> Anyone that wants to "unjoin" is free to do so. A simple request
>> by email or snail mail will suffice.

>So even the dead can remain as members until they speak up?

Yes, that does tend to inflate the membership numbers a bit. It was a moot point when NCI was first formed, but all of those whose licences have expired, or who still have licenses but are not currently active in ham radio who once joined NCI are counted as current "members." ARRL membership numbers would look pretty good if the League counted past members in ITS arguments to the FCC! And, if they did so count past members in a filing related to code testing, I bet the NCI howls of protest would lead the fray. :-)

>>Did anyone that is an ARRL member vote to approve the ARRL shifting it's
>>position to not oppose an end to code as a treaty requirement?

>Want to bet that we'll see some changes in ARRL directors as a direct
>result of that one particular shift in position?

It would be interesting to see a run for the Directorship on a "preserve code testing" platform.

As to the current international position, I very much want to see ARRL spend its limited resources (staff time and money) doing something concrete about the 40 meter issue than I want to see it expend some of those resources fighting a battle to maintain an international treaty requiring code testing for HF access in the Amateur Radio Service.

Think about it for a bit -- right now, we have an international treaty requiring code testing for HF access in the Amateur Radio Service -- an international treaty. Limiting (or eliminating) ICBMs, global warming, overfishing, extradition -- THESE warrant international treaties. When Morse code was THE primary mode in all radio, or at least part of the mainstream, I could understand the reasons for an international treaty. But frankly, with all of the problems the world faces right now, just about the last thing they need to be debating, IMHO, is the need for an international treaty on Morse code testing in Amateur Radio.

If the League were to spend any significant part of its spectrum-protection resources fighting such a cause, they would lose me as a member. I have told Tom Frenaye that, in so many words. But your views may differ, so I encourage you do do the same with YOUR Director.

Nice tale.

Sure wish we could take you seriously, Cecil. ;-)

Of course at least one of Rand's book heroes knew the code, and didn't complain about learning it. Early in the book, Dagny is a [signal tower] operator at "Rockdale", and in those days operators all knew the code. Therefore Dagny knew it and was skilled in its use.

RE: Digital:

Then perhaps we should get the artificial symbol rate limits removed from the rules. If someone can figure out how to cram in a 9600 baud transmission into a SSB signal on 30m, he shouldn't be limited to a symbol rate of only 300 baud. BANDWITH ALONE of the signal should be the governing factor.

Likewise, on the higher end, doesn't the artificial SS hop pattern that's mandated by our rules also limit things? Granted on 33cm and shorter, there's no more symbol rate restrictions, but aren't we severly limited in playing with different hopping sequences to find something that has larger throughput for the same bandwith and selected frequencies...?

The specification is available in .pdf format from icomamerica.com
"RTTY" usually means Baudot as it does in this case. The specs
do not address most of your questions. Most late model ICOM HF
transceivers support a digital input to the built-in FSK generator.
Hopefully, there's a digital output from the FSK decoder. If so,
PACTOR might be implemented in software in a laptop.

> One of the biggest problems of the "keyboard modes" is that there are
> so many of them.

I have standardized on PACTOR I & II. RTTY and PSK31 are too
error prone for my tastes. We have forward error correction
for CW, might as well have it for other digital modes. :-)

While a lot can be said of this group, cardboard characters are not among them and her characters are a bit limited having to wear white or black hats all the time. This bunch wouldn't recognize a limitation if it drove over their toes on a tricycle. And someone would try to link Squiggy and Cheers to the black hats -- which may not be that much of a stretch.

TMHM is Heinlein's best to me because among a lot of other interests I was an undergraduate Econ major. The layout of a lunar colony made a lot of sense to me as did UN politics of the vintage (which may not have really improved given the five new Security Council members coming on this month are Syria, Bulgaria, the Cameroon, Guinea, and Mexico; I feel more secure

already). Like everything of Heinlein at his best, it is a romping good story.

I agree. I have been asked by our DC office to do some studies of the occupied bandwidth of present-day Amateur signals (with occupied bandwidth being the bandwidth at the -26 dB points.) . . .

>Likewise, on the higher end, doesn't the artificial SS hop pattern that's
>mandated by our rules also limit things?

At one point, I believe only two hopping sequences were permitted. The FCC changed that about two years ago. It was shameful -- for a while, one could go to Comp USA and buy spread-spectrum radios that operated on 2.4 GHz and use them under Part 15, but they would have been illegal to use under Part 97.

Equally shameful, or perhaps even more so, is now that it IS legal to use those Part 15 devices under Part 97, at much higher powers and with no limitations on antenna gain, hams are not doing so.

A candidate need not run on that platform. All he needs to be is
someone other than the guy who voted to change with the wind.

> As to the current international position, I very much want to see ARRL spend
> its limited resources (staff time and money) doing something concrete about the

I've been a ham for 38 years. In 38 years, nothing has been done about
40 meters despite the time and funds the League has already spent on the
issue at past world conferences.

> Think about it for a bit -- right now, we have an international treaty

> testing in Amateur Radio.

Lucky for us that the ITU doesn't concern itself with matters of global warming, nuclear disarmament, extradition or overfishing. I don't feel badly that a communications conference should deal with communications matters, no matter how trivial some see the issues. All the voting participants are getting paid to attend.

> If the League were to spend any significant part of its spectrum-protection
> resources fighting such a cause, they would lose me as a member. I have told
> Tom Frenaye that, in so many words. But your views may differ, so I encourage
> you do do the same with YOUR Director.

Naw, I'm not a one-issue guy when it comes to governmental or amateur radio politics. I certainly wouldn't leave a political party or an organization of radio amateurs over one single issue. I think you should apologize to Tom for your one-issue mindset.

I decided though that I won't contribute money for the conference effort. If the League can afford to hire the big time, non-ham, lady fund raiser from the corporate world--you know, the one who sent me two letters over the course of three weeks telling me what MY RESPONSIBILITIES toward amateur radio are--that Newington has waaaay too much money already.

By the way, if you run into the fund raiser, tell her that I think she should realize her responsibility toward amateur radio's future and donate her salary to the cause. I don't take kindly to receiving advice from some woman who likely heard about amateur radio less than a year ago. In the past, I've donated for the building you work from, the W1AW station renovation and to the Foundation (on more than one occasion) as memorials for friends who have become silent keys. I also put my money where my mouth is by becoming a Life Member about 25 years ago when what doesn't seem like a lot of money now was a big chunk for a young ham with a mortgage.

Back in the mid-seventies, I shared a stage on more than one occasion with Muddy Waters and his band (in fact, last night's "Mountain Stage" on WV PBS TV featured pianist Pine Top Perkins and guitarist Bob Margolin from Muddy's Band). If Muddy was still alive, I just know he'd have supported continued code testing. I'm pretty sure that the late Albert King (with whom I also worked) would have supported continued morse tesing. It's a musical thing, don't you know.

I love Cecil's new quest: Gathering support from the dead.

You are a supposedly intelligent man :) (for you've told us so on
numerous occasions) yet you seem to make up so many incorrect
translations of the comments of others. ;-) I read Jim's comment and
got it as, "Jeez. Not this gain. That's a worn out shoe if ever I saw
one". Are you incapable of taking someone's comment at face value =:(
or are you simply not being serious? :o

There you go, Cecil.

Her WORST book, by far. Not worth the time to read it.

btw, she did some short stories 'way back before the novels that were only recently published. There were also entire chapters removed from "Fountainhead". I've read those, too. Much of it is quite awful, which simply shows that ol' Annie Rosenberg learned her trade pretty well over time.

--

The books are also a bit of a window into a different time, when the spaces betwen cities were vast and dark and when people spoke of "the press" rather than "the media" because the #1 means of mass communications was newspapers. Back when railroads were the predominant means of land transportation and foreign competition was unknown to American industry.

Rand's philosphy is interesting but incomplete. Her novels have certain interesting holes in them:

- None of her characters has any real family ties or a happy marriage.
- Her heroes hop into the sack spontaneously but there are no consequences (like babies).
- Her characters' physical appearance always matches their character.
- No matter how much her heroes neglect themselves or common sense safety rules, they never get sick, hurt or make a mistake due to impaired capacity.
- Natural disasters play no role in her books, even though they are about industries that constantly battle the weather.
- None of her characters has a hobby, avocation, spiritual life or any real interest outside of their work.

Ya gotta wonder what she'd make of the Internet.

Which is why a BRIEF statement of qualifications ("I have been a
licensee for thirty years, and hold a degree in social engineering,
etc") in any filing is invaluable for establishing standing and
sorting out the "knowledgeable" commenters from the "shooters off of
the mouth/pen/keyboard".

I was not aware of this last fact (and perhaps others weren't either). Maybe
when I have some "money to burn," I'll get a wireless lan transmitter and a
2.4GHz amplifier (20+W) and see if it raises the noise floor on my voice
repeater's 2.4GHz input. Don't expect this soon. It will also be interesting
to see how many birds end up fried on my roof.

It doesn't take me anywhere near a minute to send 20 words via CW.

PACTOR 2's speed is determined in large part by the S/N. How much S/N
do you need to get that sort of speed? The website doesn't list wpm,
either.

> How does one minute of PACTOR II operation compare with 48
> minutes of CW operation as far as power consumption?

Doesn't matter if you have to keep everything running all the time.
Which is the usual case in emergencies - everyone is listening.

> > > Plus PACTOR II has a throughput
> > >about 50 times higher than CW so CW consumes many magnitudes more power over

But it's not about YOU, Cecil.

The "economy" PACTOR 2 box costs $649 and the big one goes for $950.
Plus a rig and a computer.

Yes, Dave, that's exactly what it is... proper morse operation is a musical thing. Admittedly, it tends to be monotonic but... it's HIGHLY rhythmic requiring fast twitch muscles and clear, clean rhythmic perception. Anyone who does it well and thinks they're not talented is only kidding themselves or has never really thought about it. Not just anyone diddly-bopping down the street could be trained to perform at those levels.

So, Dave, what do YOU think? (truthfully)

Rich
Remember I said monotonic not monotonous... ;-)

It must be nice to have a rural QTH far from the light-dimmers,
neon signs, unshielded battery-chargers and other miscreant sources
of FCC-approved RFI.

I, on the other hand, am a denizen of a noisy, rf-infested
suburban ghetto and I am more than appreciative of stations willing
to run enough power for me to hear them over the din. Not only
is life too short for QRP, my sanity becomes periously thin when
having to dig somebody's piss-weak signal out of the splatter and
inadvertent mixing products from the local 50 kW religious
broadcasting outlet.

Wake up, Hamdom! It's time to consider the little guy in the hobby,
the fellow who doesn't have the big bucks to move to the country and
commute to work with a gas-guzzling SUV.

My motto: If you can't lower the noise floor, raise the power ceiling!

PACTOR II is actually less than 500 Hz wide and I would say it
chirps rather than beeps. My 500 Hz filter works just fine on
PACTOR II signals. It a heck of a mode, Brian, and well
worth the money, IMO. It is the one amateur mode that I
have ever used that runs circles around CW.

Since NCI doesn't publish any membership stats, what difference
does it make. If it is a problem, it only
affects internal NCI activity and records.

Good point. One other way we "lose" members is when we
send out a communication. We do "lose" members when they
don't keep us (NCI) updated on their current email address.

Of course our 1.8Mhz to our light wave bands are under fire and we're
subject to losing all of them by one means or another. But there is no
particular threat to our mostly-exclusive HF *allocations*, the HF P15
stuff is interference with us who are the primaries in those
allocations as you more than just understand. The far more serious
threat to our inventory of allocations lives 'way up the spectrum
where we can lose the actual allocations due to non-occupancy. Which
was my point.
>

That would be because it isn't right. I believe as Arnie doesd, that CW should be retained as an alternate to whatever main mode is most used, probably SSB and FM voice.

> CW is not the mode that is
> most often used for emergency communications by a long shot, so no regulatory

>

Why should not the most basic, most easily implemented and most efficient radiocommunications mode (in terms of what is produced as opposed to the complexity and power requirements of the gear needed to produce it- see N2EY's recent post on that subject) be retained as a valuable asset within ham radio? Why should not regulators view that very fact as adequate reason to require the majority of mainstream ham radio operators to be at least minimally qualified? (not that it will happen).

So you believe that non-hams who comment on FCC proposals are then more competent to do so than active, longtime licensed hams? I suppose that refugees from Channel 19 or the region just below, and even gthe illicits just above, 28 Mhz are competent. Ok, if that's your view, that's your view.
I think you will surely agree that FCC has historically relied on licensed hams for the majority of their data and information used to formulate new regulations for the ARS. Why not? Not that many FCC staff have experience and expertise in ham radio. Many licensed hams do. And I don't think they have relied on the ARRL for large amounts of input for no good reason.

Well, along with deregulation and downgrading tests (commercial licenses as well as amateur), has come the all-knobs-to-the-right operators. Even FRS transceivers (which are SUPPOSED to be not-user-adjustable) have had their deviation turned up to make it 'loud'. Maybe the CW forever gang has a point. Myself, I enjoy 440 FM. You'd be surprised how close by the control ops are. These are not the 'NUT' control op types. Show up on one off frequency or over-deviated and watch how fast the control op shows up (time usually can be measured in milliseconds).

You also don't see many ham stations using Orban 8200 processors,
either (they cost a LOT more than the most top-end rig).

As far as broadcast audio quality goes, don't get me started now
that the setting of the processors has been almost universally
taken out of the hands of the engineering staff and given over to
program directors and air staff.

That's easy say, not always easy to do, particularly when a ham is suddenly thrust into a situation where he needs instant communications and all that stuff is not at hand. If you have ever rigged a laptop for use with a HF radio for digital work you should know that it is not merely a "plug and play" operation. You must research the radio and computer manuals for input and output requirements which can vary considerably among radio gear, then build whatever interface is required, with consideration and thought to levels required, PTT needs, etc. Some of you guys seem to think this is trivial and quick. No.

So you aren't familiar with the fact that emergency communications can be required at the most inopportune times in just as opportune circumstances, and that all can be previously set in place for instant use. That shows that you really don't know much about the requirements of emergency communications. Just because the HT jocks working the EOC's get the press does not mean that is what it's about. Aa dozen years of work in planning for communicatioins needs resulting from a major earthquake resulting in widespread destruction formed my thinking on the subject.

>> oppose an end to code as a treaty requirement?

Nope. In fact, there was simply a quiet announcement in late December 2000 that
the issue would be considered in the January BOD meeting. Only a few days were
allotted for members to make their views known to their Directors. I made mine
known and spread the word as much as possible.

>> Most any prganization
>> establishes a range of allowed policy setting to the BOD rather
>> than calling for an all member vote on every action/issue.
>
>Want to bet that we'll see some changes in ARRL directors as a direct
>result of that one particular shift in position?

Maybe. But the way various Directors voted has NOT been made public. My
Director called for the vote to be recorded, but was voted down by a majority
of the others. What this means is that the only way to know how a Director
voted is to ask him/her. Maybe you'll get an answer, maybe you won't. I know
how my Director voted, but none of the others.

The whole thing was done quietly. One would think that if the majority believed
they were doing the right thing, they'd be proud of it and would want it
publicized.

I am currently mostly a QRP operator - 5-10 watts for most QSOs. The most power I have ever run using my own station is about 125 watts output. Been at this 35 years and hope to be at it at least that much longer.

In article <9Hp08.100611$fe1.1274606@bgtnsc06-news.ops.worldnet.att.net>, "Jim Bromley, K7JEB" <j.e.bromley@worldnet.att.net> writes:

>inadvertent mixing products from the local 50 kW religious
>broadcasting outlet.

The funny thing about QRP is that the stations I work don't know I'm QRP until after a few go-rounds. 599s are not uncommon from my 10-watts-to-an-inverted-V-at-35-feet.

Then again, I run almost all CW.
>
>Wake up, Hamdom! It's time to consider the little guy in the hobby,

>commute to work with a gas-guzzling SUV.

That's ME, to a T! As a "little guy", I say that my results are NOT, repeat NOT, reduced by the existence of the "big guns". Lowering the power limit will NOT make it better for me, either at the QRP level or the 100 watt level.
>
>My motto: If you can't lower the noise floor, raise the power ceiling!
>
Yup.

There are times when 15 watts is more than enough, and other times when 1500 watts isn't enough.

What does MY transmitted power (or yours, for that matter...) have to do
with your ability to receive?

>I, on the other hand, am a denizen of a noisy, rf-infested
>suburban ghetto and I am more than appreciative of stations willing
>to run enough power for me to hear them over the din.

Still comes down to YOUR receiver...My QTH in rural Tenessee
notwithstanding, there are numerous occassions when my noise level sucks too.

But it's amazing what an active antena and some DSP can do to fix
that...and the other guy didn't have to change things by so much as a watt.

>Wake up, Hamdom! It's time to consider the little guy in the hobby,
>the fellow who doesn't have the big bucks to move to the country and
>commute to work with a gas-guzzling SUV.

I have a Ford Contour and an old Yaesu FT757 with an outboard DSP.
Hmmm......

>My motto: If you can't lower the noise floor, raise the power ceiling!

Let's see.....DSP unit for $150 or Linear Amp for $800 and the associated
increase in power bills.....Hmmmmm......I might increase my signal at HIS end
by a couple dB, but still can't hear squat cuz I didn't fix things on MY
end......Guess I opt for the DSP!

And if the prior arrangments don't work out, or you experience a (highly likelyO) equipment malfunction that takes your station off PACTOR or whatever digital mode you "prearranged" then you can toss in the towel. Think it doesn't happen? I have personally experienced just exactly that sort of failure. On the job.

> As stated, to do so requires advance participation in emergency planning.

I probably have more time in the chow line than you have in emergency planning. One thing I learned early is that the best laid plans frequently don't work as expected. Rely solely on them at your peril.

CW is NOT going to be outlawed, Dick. Why do you act like it is?

> Voice modes. It is always easier to talk than anything else. This NG (Cecil in
> particular) has proved that beyond any shadow of a doubt

I haven't used HF voice modes for more than a year, Dick. I do mostly
CW with some PACTOR.

That's because you don't know better. At times it takes lots of power to work those 100 watt DX stations. I had to turn on a full 1400 watts on CW to get the Heard Island group on a dying 20 meter band, they could tell I was there with the
100 watts but no copy. And when you become DX you see it firsthand. It's a real zoo out there as heard from across the pond.
Besides, FCC already worked out the deal on power. They found that 1.5KW caused almost no additional problems to consumer devices than 100 watts did. And there has long been rules in place requiring hams to use the minimum power required to complete the desired communication. I for one very rarely turn on my amp because I don't often need to.
Bill you should gain some HF experience before making sweeping prouncements on operation there. An Extra Lite alone won't do it.

I think you mistated the case. Hams were not only willing but eager to abandon spark in favor of the efficiency and bandwidth reduction of tube based CW. SUch is simply not the case today when comparing CW and voice modes to the high data rate capabiligties of the advanced digital modes. The reason is not hard to find. There is simply no imperative nor need for hams to use high throughput, neither as an operational requirement where almost all contacts are conversational in nature, nor in handling basic emergency traffic. We are not commercial banking concerns requiring vast amounts of data to be transferred quickly. In no concievable emergency situation- and I have as a public safety communications officer, handled emergency traffic situations- is it ever a pressing need. The main need for communications in emergency situations is the need to pass basic information, which can easily be done by many normal non-high tech methods.
This is not to reject those efficient methods and their improved techniques, but rather to note that vintage modes are just as useful and should not be relegated to the scrap pile of history just because newer methods exist. They do not exist on anywhere near the widespread basis as the older modes.To reject the use of "lgacy" modes in emergency communications on that basis is unrealistic and indeed irresponsible.

Give me an HF rig, portable antenna, emergency power supply, and a straight key, and I can be up and running in about 10 minutes. Add an extra minute if I'm going to use my paddles and an electronic keyer running off of a 9v battery : -))

More realistically, it's too much extra gear to carry around when it's not
needed.

What I do or do not "realize" is immaterial to the discussion, and you may draw no such conclusions from my statement. My point was simply that a transmitter running PSK31 with a CWID where the PSK31 cannot be copied but the CWID can be, is a very revealing facet of real life, day to day radio communications. What it shows is that there is always more to consider than the underlhying theory.

> RTTY and PSK31 are not the best
> choices for emergency communications but PACTOR I & II are very

>

And from a purely efficiency standpoint radiotelegraphy isn't anywhere on the radarscope. But again, there is always more to consider than theory. A Mercedes is a much more attractive option than a Plmouth Neon, but both do the same job.

I think I'd already learned morse before I picked up a musical
instrument. While I think an inclination toward music and ease of
learning morse can go hand-in-hand, I believe that just about anybody
diddly bopping down the street. Remember, many folks play an instrument
but not many can do it so well as to make money playing. Many folks
will never get really good at morse but can still use it adequately.
I've only met one person I considered hopeless as a guitar student and
I've yet to meet the person who can't learn morse. Perhaps he or she is
out there somewhere.

After playing guitar since 1963 and after taking a year of music theory
in school, I STILL can't sight read worth a damn.

Judging by the modes actually used by hams ("consumers") on HF/MF, SSB voice wins and Morse/CW is a close second. All the other modes are way behind.

It also requires that you have equipment capable of being set dead-on
xx.yyy.zzz MHz with a VERY small error. If the available equipment can't do
that when it's needed, you're back to tuning around and hopefully finding the
station you want to work.

If you want to run any sort of net operation, ALL stations must be capable of
being dead-on frequency and staying there.

All of this is tough enough in a nice warm dry hamshack. Will the rig still be
within 10 Hz when it's cold and wet?

Okay, but that doesn't change the premise of the question, in fact, it better drives home the point that the amateurs of our past embraced new technology. Had Amateur Radio NOT had a history of embracing new technology, how long do you think their allocations would have continued?

From: kelly@dvol.com (Brian Kelly)

>But there is no particular threat to our mostly-exclusive HF *allocations*,

Don't discount the threat from that Part 15 stuff, Brian. IMHO, it is more insidious than a direct spectrum grab, in many ways. The rules give us absolute protection from interference, but that sounds a lot better in the rules than it works out in practice. It is time-consuming at best, impossible at worst, to locate an individual source of noise. And there is nothing that can be done to deal with an aggregate of interference from hundreds of devices.

Even so, there are indeed active threats to allocations on HF. One of the 40-m solutions on the plate calls for 200 kHz amatuer-exclusive. And the HF digital broadcasters are looking for a place to do their thing.

From the info at:

http://www.arrl.org/news/bandthreat/

"WRC-2003 Consideration of the 40-Meter Amateur Band

The problem is that since 1938, the 40-meter allocations in the three ITU radio regions are different. Region 2 has 300 kHz from 7.0-7.3 MHz, while Regions 1 and 3 have 100 kHz from 7.0-7.1 MHz (7.1-7.3 MHz in these Regions are currently allocated to the broadcasting service). WRC-2003 agenda item 1.23 is an opportunity to realign the amateur and broadcasting bands around 7 MHz. The amateur service seeks the return to an exclusive, worldwide allocation of no less than 300 kHz in the vicinity of 7 MHz. For further information see http://www.iaru.org/7-MHz-Spectrum.pdf.

Studies of WRC-03 matters relating to the amateur services are conducted in ITU-R Working Party 8A. WP 8A is developing text for the Conference Preparatory Meeting, which is charged with preparing the technical basis for WRC-03--the so-called CPM Report. ITU-R WP 6E (broadcasting emissions) and WP 9C (HF fixed service) are interested working parties, and are exchanging information with WP 8A.

There is a potential threat that the possible expansion of spectrum below 10 MHz by broadcasters may complicate consideration of the amateur band at 7 MHz. See the item related to HF broadcasting, below. "

and

"HF Broadcasting Expansion and Digital Modulation

WRC-03 agenda item 1.36 calls for the WRC "to examine the adequacy of the frequency allocations for HF broadcasting from about 4 MHz to 10 MHz, taking into account the seasonal planning procedures adopted by WRC-97."

HF broadcasting now has regional allocations of 3950-4000 kHz in Region 1 and 3900-4000 kHz in Region 3, and footnotes affording very limited use of 3950-4000 kHz in Greenland. We will resist any expansion of broadcasting that would further reduce the usefulness of the 3500-4000 kHz band to amateurs in Region 2.

Another agenda item, 1.2, provides for a review and taking any required action concerning possibly dropping the idea of HF broadcasters changing from double-sideband AM to single-sideband modulation and migrating, instead, to digital modulation, known as Digital Radio Mondial.

It is too early to tell, but there is the possibility that HF broadcasters might obtain additional spectrum during the transition from analog AM to digital broadcasting.

Both of these items could add confusion to the already difficult WRC-03 agenda item 1.23, that of realignment of the bands around 7 MHz. "

No, Dick, I believe that our governement should make its decisions with input from knowledgeable people.

If you truly misunderstood, I really can't think of a way to say it differently.

>I suppose that refugees from Channel

The position is initially operating at a defecit. The expectation is that, in the long run, the investment will pay off as more than the traditional sources of revenue are explored and utilized. The end result will be more revenues with which to do more things. Every year in the Lab, I put things on the plate that get trimmed off as a normal part of the budget process. If her salary helps me to do those things a year or two from now, I am all for it.

>By the way, if you run into the fund raiser, tell her that I think she
>should realize her responsibility toward amateur radio's future and
>donate her salary to the cause.

Get real, Dave. That would be spouting nonsense and I leave you to spout your own nonsense personally. Tell you what, though, I will do just that if you donate a year's worth of your income or if she sends you a letter asking you do the same.

Posing the ridiculous to make your case only makes your case look ridiculous...

> other times when 1500 watts isn't enough.

Considering that a typical ionospheric path varies by
20 dB over a period of less than a minute, both
conditions are present practically simultaneously.

OTOH, there are times when 3 dB more transmitter power
is all that is necessary to push the DSP algorithm from
correlating noise and rejecting signal to correlating
signal and rejecting noise.

> Then again, I run almost all CW.

That buys a whole bunch of dB margin, of course, but
that detection threshold is still there. A light-
dimmer swishing across a 250 Hz bandwidth at a 120 Hz
rate will still destroy a QSO that could be had if
limited only by the quiet atmospheric noise of a
winter's night.

> end......Guess I opt for the DSP!

DSP is nice and that little Am-Com unit works wonders.
But it can't pull intelligibility out of a -10 dB SNR.
(Actually, even under the best of conditions it only
offers a 12 - 15 dB reduction in noise and crud --
not quite enough to get below my 'annoyance' level.)

My beef is with the guy who primly informs me that he
sees no reason to turn on the linear amplifier he has
sitting next to his transceiver because he is hearing
me just fine and believes he has to do his part to
further the QRP credo. (For some reason I always hook
up with this type from the mobile on 75 just as the band
is hanging it up for the daytime hours).

>repeater's 2.4GHz input.

Heck, the wireless LAN itself could raise the noise floor on a nearby repeater. The ~$100.00 devices I have purchased ran about 100 milliwatts and about 0 dBi gain antenna. I could hear it loud and clear, even through building attenuation, for about 500 feet.

There are power limits on SS devices in Amateur Radio. I believe that the power is limited to a max of 50 watts, with a further requirement that automatic power control be used if the power is > 1 watt.

I think it unlikely that birds will fry on your roof. If the antenna gain is low, the fields would be low and if the gain is high, the "near field" region of the antenna can extend quite some distance. In the near field region, the field strengths are less than what would be predicted if the antenna were a point source.

In my experience, DSP filtering offers little improvement over analog filtering of bandwidth. A 100 Hz filter will be ~10 dB improvement over a 1000 Hz filter no matter what method is used to attain 100 Hz.

The de-noise techniques can work to make a somewhat noisy signal sound less noisy, but at 0 dB S/N, their effectiveness drops to about 0 dB in my experience. And if that noise and crud is coherent -- ie, computer birdies -- the de-noiser cannot help at all. If one is listening to an SSB signal, the DSP techniques to autonotch carriers may help, but IMHO, most of these "coherent" interferors are still noise-like enough that the DSP just isn't sure enough what to do.

If we had thousands of hams working on developing better DSP techniques, I bet that we would see some state-of-the-art improvements. :-)

<dickc58@worldnet.att.net> writes:

>Besides, FCC already worked out the deal on power.

Think about this:

In the old days (before 1989(?) or so), the power limit was 1 kW input. This meant that with a typical solidstate linear amplifier, an amateur running the legal limit on HF/MF could expect no more than 500-550 watts output (average) on modes like CW or most digital modes. One could get a little more by using higher-efficiency amplifiers like tubes in Class C or FETs in Class E.

Then the rule changed to 1500 W peak. Efficiency no longer mattered and hams could run more power to the antenna. Some modes like AM lost, though.

Was there an NPRM and comment period on this? I don't remember one. It just happened by FCC fiat, as I recall. The AM crowd protested but to no avail.

What the FCC is saying to us is that they like average power but not peak power.

So what are you saying, Ed? That we hams MUST "willingly" abandon our favorite modes?

Hams replaced spark rigs with tube sets because the results were better - simple as that. "Better" included more DX, less interference, more stations on the air, and lower cost. They did not have to be forced to "willingly" give up spark because of diatribes from Final Authority wannabes.

Absoluely - just spread it out among the tests according to power level. If Element 2 only allows, say, 100 watts output on HF, then the RF safety questions on Element 2 should not involve 1500 watt output, that's all.
>

Nah. Just leave 'em alone.
>
>Amateur Extra class should have an additional examination for VE status.
>That's all I can think of for that class.

Yup. "Element V" (5) with all the VE stuff in it.
>
>You have also alluded to moving the forty meter band and other issues which
>were not licensing changes.
>
If we get a better setup for 40 than the shared mess that dates back to before WW2, some changes may be in order for 40.

But the basic concept begins to take a reasonable shape:

Tech is the entry level, with low power, a sampling of spectrum and modes, plus an easier test than today (focuses on operating and safety)

General is midrange, with more power, modes and a more technical test

Extra is everything, with more emphasis on technical

VE qualification is separate

Nobody loses what they've got now, and nobody gets a big freebie exacept maybe Techs get more HF.

What it shows is that PSK31 is a toy mode. You really need to broaden
your scope, Dick. Do you understand what forward error correction is?
Digital modes without forward error correction are NOT serious modes.

That's not true for PACTOR II, Jim. From the manual: "Never tune the VFO by hand with very weak or inaudible signals! With very weak or inaudible signals, the PTC2e adjusts its tuning very slowly to minimize tuning error." The DSP processor locates and tracks the signal by autoadjusting the digital filter coefficients. It is amazing to watch the PCT2e zero in on a signal all by itself.

I have to agree with you on that one, Dick. Most ham conversations contain
virtually zero useful information. One reason I like CW is that I don't
run out of things to say as fast as I do with the other modes.

The automatic notch filter in my IC-706 MKII works wonders on 40m at
night and the noise reduction is remarkable. I wonder how it compares
to the IC-756proII DSP? I read somewhere about delayed autonotch
filters that work on continuous heterodynes even in CW mode.

We explained to you, a couple of years ago, when you tried to make this argument before. If you can't hear the PSK31 but you can copy the CWID it's because the power/bandwith of the MCW CWID is much higher and of course you'd have a better chance of hearing that. You should have tried QPSK at the time. Although, if you did get through you wouldn't be able to trash it now, right?

If you keep relating that same story for years and years well what can we say....

My view is that the ARRL is a non-profit membership organization which
has no need for such a position. We all have to trim things from our
budgets. Our wish list almost always defies the reality of our pockets.

>

Sorry, Ed, I'm a retiree on a small income. I just don't feel like
resonding positively to someone who is not a ham, not knowledgable about
ham radio, doesn't really care about ham radio and who makes a
transparent pitch to get my money. After all, this Jeanette-come-lately
has outlined *my* responsibilities to something she knows nothing about.
I'm a League member and I care about how the League's funds are spent.
I don't happen to believe that hiring such an individual makes good use
of the League's limited (as you pointed out) resources and I don't think
it sends a particularly good message to the membership.

> Posing the ridiculous to make your case only makes your case look ridiculous...

I don't think so, Ed. I think what happened is that my feelings toward
whether the League should employ such an individual and my feelings that
this individual knows nothing about amateur radio and cares nothing

about amateur radio have been aired publicly. That her second form letter to me (and the preachy tone it took) honked me off as it did might make you think that it effected others in the same manner.

That simply isn't true. You told us what she *would have* thought about morse testing. You made no reference to discussing morse testing with her and it would be pretty hard to prove or disprove that you had such a discussion. You put words in the mouth of a dead person.

[remainder of fairly good and mostly justified rant deleted to
save space]

There are some shining counterexamples, too, like the guys I was
listening to yesterday morning (Sunday 13 Jan) on 40 meters; they
had _lovely_ sound: clear as a bell, full, rich, low-calorie^W^W^W
everything you could want -- and on SSB, too. And it wasn't all
due to my FRG-100, either: some other QSOs nearby sounded like a
heavy metal band singing. No, I didn't get the call for the guys
with the good signal, but I'll listen again next Sunday AM.

I'm in the Oklahoma City area (5-land), but I think that the good
QSO was a K0 talking with a VEsomething. _Good_ longwire antenna!

I'm going to assume that you asked that question with your tongue
centered in your mouth.

If I am transmitting at 100W and my signal is 1db below your
noise floor, then increasing my TRANSMITTED power by 3db
should put me 2db above your noise floor, and enable you to
receive my transmissions.

With all kind wishes,

Albert was a great blues man but not a very pleasant person. He
insisted that his sidemen call him "Mister King" and they received only
union scale for gigs. They were quite surprised to learn that Big Joe
Duskin's band did an even split of the loot.

> I understand that state of the art musical synthesizers have much

"K0HB" <K0HB@arrl.net>
>
> And after it's all said and done, whether the ERP comes
> from amplifier gain or antenna gain, it's still the same ERP
> on the air,

Actually, it's not the same.

There are two ways to get "antenna gain" from a transmitting antenna:

1) Reduce losses in the system

2) Concentrate the radiated energy in the desired direction (which requires reducing it in undesired direction)

Both "amplifier gain" and "antenna gain 1)" increase the signal strength to all receivers. But "antenna gain 2)" increases the signal strength to the intended receiver while DECREASING it to receivers that are not in the desired direction.

In other words, those with big antenna farms are doing us a FAVOR by aiming their RF in precise directions rather than heedlessly blasting away in all directions.

Not only should ERP not be limited, but the users of large directional arrays are to be commended for their consideration of other hams. Just another reason why anti-antenna CC&Rs are a bad thing.

> so all your high sounding bias against "big guns"
> is just so much envy, it would seem.

I have run marathons. So have world class runners. Of course I took a bit more time to run 26.22 miles than a world class runner does. Am I envious of the guy who wins the race? Nope. We both did the same thing, he just did it better and faster than me. Same thing applies to the big gun contest/DX stations.

Mike, I published the IEEE definition. That's what started the ruckus.
"continuous wave - A carrier that is not modulated or switched."

I did NOT discuss Morse testing with her. I am inferring what she would
have said based on the plethora of her writings condemning unnecessary
governmental regulations. There are many other topics upon which we
could make a valid inferrence based on her writings. I'm sure dying
did not change her mind.

Operating in plain English means performing a function. A person taking
a Morse exam is performing a function. It is not I who has "too fine a
point".

Non-hams are banned from being control operators. A non-ham can
still "operate the station" (push the mic button, talk into the
mike, punch the keyboard, pound the Morse key) under the direct
supervision of a licensed control operator.

Part 15 does not have any content restriction - Part 97 does.
That's why the original specs were set - to ensure that the Commish'
could df the signal and intercept and verify compliance of the
content. The specs were relaxed when new equipment came into
service.

How can you disagree that in ham radio, 'operating' means to get on the air?
That's we what we mean when we say 'operate'. Debating points notwithstanding.

> A person taking
> a Morse exam is performing a function.

Ergo, taking an exam is the same as getting on the air.

Good heavens! Do we pick and choose what "dictionary" we're going to quote from just to score a point? Ham Radio, or computers, or just about any activity has it's own lingo, that's why when some people say somthing is bad, they mean it is good. Under your definition, every single activity in Ham radio is operating, including scratching ones backside.

Come on, you can do better then that!

That all depends on its actual frequency sweep..... Just because part 15 devices are permitted from 2400 to 2483.5 doesn't mean that they hop on enough frequencies to cover the entire range - there could be holes....

You haven't seen these birds.... Many like to perch on my antenna ground radials or on the yagi masts between the elements.

A 20 watt signal into a 23dB gain antenna is going to be equivalent to about 4000w ERP [and one heck of a field strength within 1 meter of the antenna]. Microwave ovens are only in the 750-1250w area. Granted, the latter is inside a resonant cavity, but in sheer power, "Mr. Blue Jay" isn't going to live.

On 1270MHz, I know someone who claims that he loaded his 20+dB yagi antenna with 100 watts and burned off the paint on the exterior of his neighbor's house in a nice 2' circle at 30 feet away over the period of less than a week. I don't remember if this was an accident....

In closing, all I will say is that it's possible. Probability is a separate issue.

I can't say, Ed. But the fact is that the "new technology" exponentially
improved the lot of radio men of the era.

Can we say the say of digital modes and digital voice as it pertains to
Amateur Radio?

Certainly a lot of fun and in some cases even beneficial...But what does
it say that some of these modes have been around a while yet have not been
aggresively embraced by Radio Amateurs?

I liken it to the guys who go fishing with sonar, salinometers, temp
gauges, etc. Do they really have any more fun or catch a "better fish" with
all that stuff? It's great if you are a commercial fisherman or are a tourney
fisherman, but what does "every day" fishing need it for?

"State of the Art" isn't JUST an advertising buzzphrase. It SHOULDN'T BE an advertizing buzzphrase!!! Usually, when anyone uses it, it's misused because by the time anything gets to market it's NOT "State of the Art" anymore... ;-)

PacTor is nowhere near "State of the Art". (I rest my case) ;-)

> Like "paradigm shift" and
> all those other 80s/90s jingles. They're all boom-dot-bust now.

I can't believe you said that. A "paradigm shift" is legitamate (real). It says nothing about how "modern" (there's a word for you to mock) something is. paradigm shift merely implies a new way of looking at something. Copernicus is the poster child for paradigm shift. He caused a paradigm shift in how we see ourselves in the universe. A paradigm shift doesn't have to be that dramatic either. There can be very small almost insignificant paradigm shifts. Also, paradigm shifts aren't neccesarily always positive. We can experience negative paradigm shifts, too. Think about shifts in our society and how it's currently viewed.

If you were listening to the talking heads on the alledged news programs touting the information revolution and the dot coms boom you were being lead down the garden path. Be mindful of the fact these people will invariably say something is ironic when irony had nothing to do with it. In other words they don't know what they're reading most of the time.

> >Your mileage may vary. My choice is clear.

Absolutely, but remember, never say never. ;-)

> And hopefully there will be somebody else on the air using PACTOR II if
you
> ever need it....

And now... for something completely different.... ;-)

PACTOR II is "state of the art" for amateur radio, i.e. the best we
have. Can you think of any way to technically improve upon PACTOR II?

> So becuase he won't add a filter or preamp to his rig (under $200) I need to
> add a linear (in excess of $800 and recurring electric bills)...?

I'm not asking you to add anything. Just understand that I'll probably choose to ignore your station in favor of someone I can hear.

My rig is fully loaded with all available filters, in addition to DSP. (It also has a two-level selectable preamp, but pre-amps are mostly fluff added to impress the uninformed.) I also have a well-engineered antenna farm which has enabled me to make DXCC honor roll and to be a competitor in most radiosport events. I reserve the right to ignore piss-weak signals unless they indicate an emergency.

If you insist on running QRP, don't get all "noble" about being ignored. If you feel that you can't afford the amp and electric bills, get a better job
or learn to live with the shortcomings of your radio station.

QRP is for sissies.

With all kind wishes,

de Hans, K0HB

My other hobby is walleye fishing. I'm not a "tourney" fisherman nor a commercial fisherman, but I equip my boat with every tool that I can afford (for the same reason as those other guys do -- to find fish.)

My walleye rig has 7 sonar transducers, 3 sonar displays, 2 GPS receivers, and marine VHF radio.

I use a PinPoint brand electric trolling motor which can be set up to follow a certain depth level or a certain distance off a shoreline. It can also reproduce (with 2 meters) a track that I have previously trolled and saved on my GPS. All automatically, while I simply pay attention to fishing.

I don't *NEED* as damned bit of that, but it sure is great fun to have.

I find that many of the "noble" fishermen with lesser equipment tend to keep a set of binoculars handy so they can follow me to my fishing spots which I have found with superior electronics.

With all kind wishes to those who can't afford the toys,

I doubt it'll be me. I don't plan to dump big bucks into a very proprietary interface just to be able to do it. I might use Beezly's "Ritty" program if I could try it first and make sure I *could* use it before springing loose with the bucks for it, but when I ran across an "evaluation copy" on a Brit website, downloaded it and tried to set it up, the "evaluation time" expired before I could ever get it on the air. Must have been good for all of 15 or 20 minutes.

A far better queuestion is "Why did hams embrace new technollogy?" The answer is very clear - the newer technology was far more useful for their purposes. When you can say that about the newer technologies of today you will have far fewer hams on SSB and CW and many more using the newer technologies.
As always, hams have very little need to transfer vast quantities of text or data in their person to person contacts on the air, nor in most cases during emergencies. So the newer technologies get a look and draw some following, but as always, hams use what they like in the absence of good reason to do otherwise.

Only if the digital operator is interested in doing so. Observations indicate
not many are.

>>If he is in QSO with you, Steve, the more power you are running, the louder
>>you will be in his receiver.

> So becuase he won't add a filter

For SSB communications, adding a filter to the existing ~2500 Hz SSB filter already in the rig is not going to buy anything. 2500 Hz is pretty much the necessary bandwidth for SSB. On CW, one can narrow up the bandwidth from the typical 500 Hz bandwidth in today's rigs to about 100 Hz, using either an internal or an outboard filter. This can be either analog or DSP -- the effect will be the same.

> or preamp to his rig (under $200)

If, as originally stipulated, his reception problem is caused by local noise, adding a preamp will only cause him to hear more noise. The ONLY situation a preamplifier solves is to improve on the sensitivity of an inadequate receiver. On HF, with any sort of reasonable antenna, the receiver is sensitive enough that external noise is much greater than the receiver input noise. In those cases, adding a preamp solves nothing, either.

One can get some amount of help making a somewhat noisy signal less noisy using some of the DSP de-noise algorithms, but that techique has its limits, especially for SSB reception.

>I need to add a linear (in excess of $800 and recurring electric bills)...?

The 5 watt QRP station could ask the same question, as could the 100 milliwatt QRP station.

The answer is that if your signal is below someone's external noise level, if you want them to hear you, you will have to increase the level of the signal you transmit in his/her direction.

formed my
> thinking on the subject.

I repeat again...it is those that are prepared that will heed
the call and get it done. Indeed, even you admit it is the
preparation (EOC) that makes it all happen. Might an
occasional person suddenly be involved...certainly, but I still
believe it is those that are prepared who are then ready
to serve.

So what's your point...preparation is a waste of time?

Do things happen that upset the best laid plans? Sure
they do...BUT the planning still works 99% of the time.
Those that participate get it done. Those that don't and
are waiting for their 15 seconds of ham emergency
calling due to a sudden problem in their neighborhood
are usually never going to be called.

Sure, the "roll of members" is still a discrete number and
easy enough to tally. It isn't a "deduct", they are just dropped from
our database of members. Like most databases, it can
tally a sum of all.

Since you had no discussion of morse testing and since she didn't
address morse testing in any of here writing, we're left with Cecil
Moore telling us what the dead believed.

Some may very well be. Why you would not expect that to be
possible is beyond me. Indeed, I'll state catagorically that there
probably are some "active, longtime licensed hams" that are NOT
competent.

> I suppose that refugees from Channel

If you believe that, then what's your concern. The NPRM comments and
subseqent R&O dropping all code testing to 5 wpm must, therefore,
have relied on the input of licensed hams.

> Why not? Not that many FCC staff have experience and expertise in ham
> radio. Many licensed hams do. And I don't think they have relied on the
ARRL for
> large amounts of input for no good reason.

I have no real problem with that. Must also, therefore, be true that the
5 wpm testing properly reflects and or accounted for ARRL input.

We had an Assistant Secretary of State for Information Management--at least our office stopped being known as the Office of Communications under his watch--back about 1994. The guy began sending out cables filled with terms like "paradigm shift", "proactive", "market the migration" and such. This particular goober even began pouching videotapes of himself addressing various groups at Main State to all embassies. His biggest mistake was to have the camera zoom out or pan while he was speaking to reveal that his audience consisted of about 15 geeks afflicted with Mego (lifted from P.J. O'Rourke--it stands for "My Eyes Glazed Over").

People are still tripping over the debris left by the fellow's "reorganization and modernization". The biggest change which I could see was that we were soon infomaniacs rather than baggy-eyed communicators.

As is the field of medicine. Your definition applies to that kind of 'operating' too, right? A doctor doesn't really have to cut tissue in order to operate. He must only perform a function, like checking your blood pressure for example.

You give probably one of the few examples where the power
appears justified. MOST, however, of the power stations
routinely operate at high power to simply drown out the other
stations (IMHO).

> Besides, FCC already worked out the deal on power. They found that 1.5KW

But you are (IMHO) an exception as many others just crank up the amp
and operate high power throughout the contest period or until they
are finally replied to by the DX station they are after.

> Bill you should gain some HF experience before making sweeping
prouncements on
> operation there. An Extra Lite alone won't do it.

My pronouncements are, in general, still accurate for most high power operators. I recall one day whan I answered a CQ from a station in Ohio during the week about 10am. The band was not in any way crowded, congested, noisy, etc. The station was "booming" in. I commented at the S level and he replied "of course, I'm running a KW." My comment to myself "What for". Truly a poor operator as there was absolutely no reason for such high power at the time and for the conditions.

Cheers,
Bill K2UNK

I was hired as VP of Engineering of Koala Technologies. I met the VP of Operations at a party. I told him my wife was a nurse and would be interested in talking to him about operations. His comeback was: "What the hell would a nurse know about operations?" When he realized what he had just said, his expression was priceless, and he called me a Sonnafabitch. We've been good friends ever since.

> But the basic concept begins to take a reasonable shape:

> Tech is the entry level, with low power, a sampling of spectrum and modes,
plus
> an easier test than today (focuses on operating and safety)

Less technical test without electronics but ALL the ARS rules pertaining to
Technician class operation or amateur operation in general should be fair

game.

> General is midrange, with more power, modes and a more technical test

> Extra is everything, with more emphasis on technical

> VE qualification is separate

> Nobody loses what they've got now, and nobody gets a big freebie exacept
maybe
> Techs get more HF.

the current allocations... ponder these...

15, 40, and 80 CW only (RTTY and data forbidden)

28.100 - 28.300 CW, RTTY and data (normal modes)

28.300 - 28.500 CW and SSB only (phone and image forbidden)

HF/MF contains two types of bands...

10, 12, 17, 30, and 160 meters no subbands between General, Advanced, and
Extra.

15, 20, 40, and 80 meters has subbands between General, Advanced, and Extra.
General and Advanced have the same CW, RTTY, and data.
General and Advanced have different subbands for CW, phone, and image.

Well, how should Technician class be included here? What are the arguments
on this? How can you come up with half that makes sense and thereby, will
fly?

Rich

I know that you have a vehement dislike for any opinion except your own, Dave, but it is my opinion that Ayn Rand would have been opposed to the Morse code testing requirement for the same reason that Libertarians are opposed to the Morse code testing requirement. Ayn Rand's principles live on in the Libertarian Party.

Yes, it does. It turns the whole question upside down.

> in fact, it better
>drives home the point that the amateurs of our past embraced new technology.

ONLY when its advantages were clearly displayed, and WITHOUT being pushed into it.

This is a key point that some folks (not you, Ed) just don't get. Spark did not have to be outlawed to get hams to use CW. AM did not have to be outlawed or restricted to get hams to use SSB and FM.

No, he wasn't.

The requirements for an amateur license in those days included "spark testing"
- and code testing. Even if a ham was never going to use spark, there were
questions about it in the test.

The test does not hinder the adoption of new modes.

Several years ago, Keswick Theatre, here in Philly.

Christine Lavin, as you may know, founded the Four Bitchin' Babes. At that
time, they were Ms. Lavin, Debi Smith, Megan McDonough and Sally Fingerett.
During Christine's solo time, she did a song called "Sensitive New Age Guys"
and asked all the men in the audience to come up on stage and back her up. So I
and several dozen others did so. Lotsa fun.

Then came the baton twirling.

Perhaps he was trying for Europe or Asia, especially at that time of day. The condx you describe, especially on 10 show that band conditions were not favorable. Just because he was loud for you doesn't mean he'd be as loud for outside the US. Seems you need to understand more on 10 meter propagation to understand that. I guess that if you can't hear anything the bands aren';t crowded. Perhaps some better "ears"? Maybe a few new high tech data modes then :-)

>interfere with the adoption of a better mode.

No, I am pointing out that back then, hams willingly exchanged spark for a
better operating mode. Today, they can't exchange spectrally efficient
digital-voice techniques for the scheme of allocating repeater pairs that sit
idle 95% of the time.

Why the difference?

do
> you plan to allow for SSB?

That's right, single-sideband is allowed but not phone. This isn't my plan... this is reality street... this is the lame-o allocations we have now. We can do single-sideband suppressed carrier and single-sideband reduced carrier but not single-sideband full carrier or FM or about 24 other phone modes. but don't get me started.... ;-)

Nope, you don't have to be dead on. You only have to be in the passband.
Even when the box is receiving CW, it dynamically searches for a signal
using adaptive filtering. You can see it tuning in on the display.

> > From the manual: "Never tune the VFO

I suspect it will pick out one of them but I don't know for sure. There are
PACTOR II mailboxes all over the world just waiting for someone to give
them a call on their published frequencies.

And you have said that ham radio is not a serious endeavor, so that makes it FB.

You can't have it both ways. Either you must 'let the market decide" and accept what it decides or you forget it. There is a reason why many Pactor and other fans have gone to PSK31.

I mean significant parts of each HF/MF band. At least half as many kHz as
Generals have. Modes: at least CW, RTTY, PSK31, SSB, AM and FM.

Note the "at least" ;-)

Let's take 'em one at a time. No changes to existing privs for Generals and
above. Please forgive/correct any typos.

To keep the Tech test simple, perhaps Techs should not get 160, 30, 17 or 12.
Just an idea, opposing suggestions welcome. Perhaps Techs should get 160 and
all of the WARC bands...

80 - 3500-3575 CW only, 3575-3725 CW/digital, 3725-4000 cw/digital/phone/image.
Techs get 3550-3650, 3925-4000

40 - 7000-7050 CW only, 7050-7150 CW/digital, 7150-7300 cw/digital/phone/image. Techs get 7025-7100

20 - 14000-14075 CW only, 14075-14150 CW/digital, 14150-14350 cw/digital/phone/image Techs get 14050-14125, 14275-14350

15 - 21000-21075 CW only, 21075-21200 CW/digital, 21200-21450 cw/digital/phone/image Techs get 21050-21125, 21350-21450

10 - 28000-28100 CW only, 28100-28300 CW/digital, 28300-29700 cw/digitalphone image Open to all classes.

If I inadvertently widened any of the 'phone bands, please correct.

The idea is that Techs should have a serious sampling of HF bands and modes, not just 10 meters and a tiny slice of 80/40/15. I'm on the fence about 160 and the WARC bands for Techs - would be interesting to hear ideas pro and con.

Bill:

I strongly advise QSY'ing to the digital modes. Not only won't you
have to put up with the tortured audio of the Microphone Morons,
but you'll find a generally more intelligent group of people with which
to communicate. My HF operation has been strictly CW and data
modes for almost a decade now.

Jim:

Well, there's absolutely no doubt that I would have to be played by Tom Hanks. Bruce Willis would be an acceptable alternate if Tom weren't available...although, when offered the part, I'm sure he'd clear his calendar!

Kim Walker would absolutely have to be played by Roseanne Barr. No substitute would do.

Cecil would not provide much of a challenge to any competent actor, although Rodney Dangerfield comes to mind (assuming he's not SK).

I suggest that you (Jim Miccolis) be played by Alan Alda.

Dave Heil should be portrayed by Dan Akroyd.

Dick Carroll should be played by William C. Macy.

Dick McCollum should be played by Sam Waterston.

Carl Stevenson should be played by Jerry Orbach.

Steve Robeson should be played by Patrick Labyorteaux.

Have I left anyone out? Any comments/gripes/suggestions?

That's simply stupid, Cecil. My own opinion is that we do not know, nor will be ever know what Ayn Rand's view of morse testing was. If you could come up with a valid method of determining her views, it wouldn't amout to diddly squat.

On with your new quest: Poll the dead.

I haven't misundertsood at all, Dave. I know that the League has long solicited funds. I just don't think they have done so very well and I don't think they have scratched the surface (even to this day -- yet) on what can be done over and above sending you a letter.

As just one example, do you know of the existance of a fund called the ARRL Lab Fund? It is endowed to help the Lab purchase the test equipment it uses to do Product Review testing? Most hams don't, yet I believe that some would contribute to this willingly. An organized and effective fundraising effort is best done by someone who knows what they are doing, not willy nilly by people guessing at what are the right things to do.

You can support the latter (the old way) if you wish, but I opt for competence over bumbling every time.

Look at Michigan..... there is no more industry here anymore. The automotive industry is constantly cutting back on personell. The support businesses that cater to the auto industries aren't a decent choice as these people are only making a little more than the Mexicans that are making after the companies have shifted their operations there, and other places.

Mostly low paying service jobs anymore (6-9 bucks per hour). A person needs to work multiple jobs in order to survive. Michigan may be a place to come back to, but if you are looking to start a career, or in a major life-changing/career changing event, don't do that here in Michigan.

It already has.

On HF/MF, the "market" has decided on SSB, which has been used by hams for 70 years and even longer by AT&T. CW is a close second.

On VHF/UHF, the "market" has decided on FM, which has been used by ham for at least 50 years and commerically for almost 70 years (thank you Major Armstrong).

Them's the facts.

Hello Carl & Bill, (Since you guys seem to be the NCI reps of the group.)

If, by some miracle, the code requirement is NOT dropped for US amateurs as a result of the elimination of S25.5, what will you guys do? In other words, what will be the purpose of NCI? I thought that "putting it to a vote" idea was pretty good. With approximately 700k licensed US amateurs it wouldn't be a difficult thing for the ARRL to arrange. (After all, the database is finite and a time limit to respond could be set.) The results of which could then become the single largest petition the FCC has ever received. (One way or the other.) Take care and 73.

No sweat, Mark, the geek dealing with ham radio at the FCC has decided that CW must go. The one think that you can't have if you're a digigeek or a government employee is to be viewed by the leading edge guys as "retro", holding beliefs in anything but leading edge, ya know, stuff that can generate big bucks. Not good for your career path. Plus Government guys gotta spend money, geeks gotta constantly come up with "stuff" to sell us all, whether or not we "need" it. Makes the world go round
. So when the FCC employee, who wouldn't be caught dead admitting that CW is a good real life communications mode, in spite of the fact that it has served as such for over a hundred years, made the decision it was pretty well cut into stone. No matter what the facts really are.

More geek-threats. If they are determined to take ham radio away for that reason there's no saving it anyway, and what resulted would be so different it really wouldn't matter to me. And no, I'm not a cw-only-and-forever type as Cecil and others have cast me because I support a code test.. I'd bet I have more digital gear than Cecil has.

> too...No sonar...

Great! And I bet you have a lot of fun at it, too. Nobody "needs" to
have anything more than the very basics if that suits their style.

But in answer to your question " Do they really have any more fun
or catch a "better fish" with all that stuff?", the answer in my case
is "YES". If you're familiar with your lake, you can find your spot.
Even if I'm *not* familiar with your lake, I can find "the" spot on
your spot, and I can return to within a dozen feet of it next week
or tonight in the dark if I want, even if it's in the middle of the
lake with no "crooked birch tree and yellow cabin" to triangulate
in sight.

With all kind wishes,

I "relieve believe" that we can't divine something from the aether if a person who has expired has not addressed a particular issue. It becomes more difficult to gather such information if there are no indications that someone who is dead had much or any knowledge of our little topic of interest. Sitting around playing games about what Ayn Rand might have believed regarding CW testing or contemplating what Beethoven might have thought of Windows XP are things I'd consider *odd*.

If you believe, as you stated, that I am against any solicitation of
funds by the League, you have misunderstood. Perhaps the League hasn't
"scratched the surface" in attempts to separate me from my money. It
sounds like we're in for a spate of ARRL telephone solicitors or cable
TV info-mercials advising us of "our responsibilities". If future
attempts are seen by those being solicited as heavy handed as these
first epistles, it'll be a long time before I decide to contribute
anything again to the League for *any* purpose.

> As just one example, do you know of the existance of a fund called the ARRL Lab
> Fund? It is endowed to help the Lab purchase the test equipment it uses to do

> best done by someone who knows what they are doing, not willy nilly by people
> guessing at what are the right things to do.

So you are describing all earlier attempts by the League at the
solicitations of funds for construction of the building you now work in,
the renovation of W1AW, contributions to various funds by the ARRL
Foundation as "willy nilly" by "people guessing at what are the right
things to do"? Neat.

> You can support the latter (the old way) if you wish, but I opt for competence
> over bumbling every time.

The old way, to my knowledge, is the only way your new fund raiser has
done it thus far. The new which has been added is the preachy tone from
a person who isn't involved with ham radio except as concerns her pay
check. The old, old way got some money from me. The new, old way has
only honked me off. She succeeded only in alienating a long time life
member. Think the campaign has worked in obtaining funds from K8MN?

Obviously, because it's fun. The fact remains that any HF digital mode lacking
forward error correction is not a serious mode.

Airplanes and radio waves had not been invented when The Constitution was written, Dave, yet it covers those aspects pretty well. Ayn Rand was a prolific writer. She stated her principles many times. That you are incapable of understanding and/or extending Ayn Rand's principles to concrete present day examples is a serious problem.

Ed Hare should be played by Steve Buscemi.

Bill Sohl should be played by Tony Danza. Or Matt LeBlanc.

(Me, I'm not around here enough to get star treatment. Just have an extra
[no pun] play me. Or Benjamin Bratt. Take your pick.)

Here's a solution someone (N0AX) suggested.

Perhaps the correct method is to FORBID the use of Morse Code in
some way. The basic "Oh yeah?" instinct should take care of the problem.
Then some hacker would "discover" the magic of sending encoded info
through the audio channel - there would be a stampede.

The techie competitiveness thrives on "I can do this hard thing
better than you. Watch this!" (bang, crash, screech, tinkle-tinkle-tinkle,
wobbadawobbadawobbadawobbadawobbadawobbada, thunk - sirens
optional)

With all kind wishes,

Very few facts are posted to this newsgroup, Hans. You can assume
that every posting is an opinion and be pretty close to the facts.

> Define "serious mode". Show proof.

A mode that tends to overcome fades, interference, and phase shifts.
Any mode that does not overcome fades, interference, and phase shifts
is not very useful for HF digital. RTTY and PSK31 are examples.

You are perfectly free to choose believe in something stupid. You certainly won't be first. Just don't expect most folks to put much credence in your view. I'm sure your belief will provide ample opportunity for entertainment as you attempt to divine what Ayn Rand thought of rap music and HDTV.

The Constitution isn't a being, Cecil. While we know what the
constitution covers, we don't know what Tom Jefferson or John Adams
thought of airplanes and radio waves. Ayn Rand's work was not done by a
group of men drafting a document which set up a government. Get real.

That you are capable of drawing a comparison between Ayn Rand and the
U.S. Constitution demonstrates a real problem.

I have no desire to restrict anyone for doing anything other than
violating my rights and freedoms.

Sorry, Dave, I don't believe in a supernatural. And Ayn Rand doesn't
need channeling. She made it perfectly clear what she believed in
her abundant principled writings.

Yup. It's a game of imagination.

Minor Hollywood mods like changing hair color/length/amount are also allowed.

Mark,

Although I'm not a member of NCI, I think it's clear they would simply
continue the quest to reduce/eliminate code testing. If S25.5 survives
WRC 2003, there's always the next WRC.

> I thought that "putting it to a vote" idea was
> pretty good. With approximately 700k licensed US amateurs it wouldn't be a
> difficult thing for the ARRL to arrange. (After all, the database is finite and

Sure - but NCI doesn't want that! The way things are going, it looks
like the FCC wants to end code testing, so why take a chance with a
poll/survey that might upset the apple cart?

The MAJORITY of those who commented on 98-143 wanted AT LEAST 2 code
test speeds, but the FCC ignored them. (This is according to an NCI
count of the comments, too!)

Consider that NCI membership consists of, at most, a few thousand
folks who have bothered to click a few buttons on the website. No
dues, no expiration, no removal from the rolls unless the member
specifically decides to unjoin.

The way things are going, I'd be really surprised if S25.5 survived
WRC 2003. You can expect code testing in the USA and several other
countries to disappear shortly thereafter.

The interesting question is - what then for NCI once their avowed job
is done?

I find that someone like Cecil, who claims to reject the cult of religion, has been sucked into the cult of Objectivism. Now Cecil will object that Objectivism is not a cult (it's not religious) but religion is not a necessary component of a cult. Objectivism is a cult of personality. A cultic flaw in Rand's philosophy of Objectivism is its belief that absolute knowledge and "final Truth" (her words) are attainable through reason, that therefore that there are absolutes of right and wrong knowledge and of moral and immoral thought and action. For Objectivists, once a principle has been discovered by (their version) of reason to be True, the discussion is at an end. If you disagree with their principle, then your reasoning is flawed. This is the same circular argument found in the Bible -- this book is true because this book says that this book is true.

But perhaps Cecil is (again) putting us on. The evidence is in his oft asked question "What's wrong with live and let live?". Central to Ayn Rands philosophy is the opposite moral principle (in her words) "Judge, and be prepared to be judged."

With all kind regards,

de Hans, K0HB

and
> above. Please forgive/correct any typos.

And... no change for Novice we're talking Technician and Technician Plus
which, without Element 1, is the same class.

> To keep the Tech test simple, perhaps Techs should not get 160, 30, 17 or
12.
> Just an idea, opposing suggestions welcome. Perhaps Techs should get 160
and
> all of the WARC bands...

Right, seems there's are good arguments either way.

On the one hand, giving them 10, 12 ,17 ,30, and 160 meters could be done
without any subbands keeping it simple and yet meaningful. This protects
the 'old corps' on 15, 20, 40, and 80 meters from any 'invasion'.

On the other hand, giving them 10, and 160 meters without any subbands and
15, 20, 40, and 80 meters with subbands is also meaningful. This allows
them to be able to buy old radios which are less likely to have the WARC
bands.

Any other pluses or minuses... anyone???

A couple of comments on the following tables. Does "digital" mean "RTTY and
data" as defined in Part 97?

If "digital" doesn't mean "RTTY and data", the subbands will look very
different then now...
You'll have a "CW only" subband and then
modify the "CW, RTTY, and data" subband to something different and
modify the "CW, phone, and image" subband to something different.

If "digital" means "RTTY and data", the subbands will look less different
then now...
You'll have a "CW only" subband and then
a "CW, RTTY, and data" subband and
a modified "CW, phone, and image" subband to add "RTTY and data".

What was your intention.

> 80 -
> 3500-3575 CW only,
> 3575-3725 CW/digital,
> 3725-4000 cw/digital/phone/image.

So does this mean the old subbands are gone?
What about 3675-3725 Novice "CW only"?

> Techs get 3550-3650, 3925-4000

Technicians don't overlap with the Novice.

> 40 -
> 7000-7050 CW only,
> 7050-7150 CW/digital,
> 7150-7300 cw/digital/phone/image.

What about 7100-7150 Novice "CW only"?

> Techs get 7025-7100

Technicians don't overlap with the Novice.

Did you mean to omit cw/digital/phone/image subband?

> 20 -
> 14000-14075 CW only,
> 14075-14150 CW/digital,
> 14150-14350 cw/digital/phone/image

> Techs get 14050-14125, 14275-14350

> 15 -
> 21000-21075 CW only,
> 21075-21200 CW/digital,
> 21200-21450 cw/digital/phone/image

What about 21100-21200 Novice "CW only"?

> Techs get 21050-21125, 21350-21450

Technicians don't overlap with the Novice except for 21100-21125.

> 10 -
> 28000-28100 CW only,
> 28100-28300 CW/digital,
> 28300-29700 cw/digitalphone/image
> Open to all classes.

So, Novice will pick up this whole band, good.

> If I inadvertently widened any of the 'phone bands, please correct.

> The idea is that Techs should have a serious sampling of HF bands and
> modes, not just 10 meters and a tiny slice of 80/40/15. I'm on the
> fence about 160 and the WARC bands for Techs - would be interesting
> to hear ideas pro and con.

I'd like to hear what comments would come out of this. I think it's a framework and if you clear up my questions I may draw a chart to see what it looks like.

Thanks

Rich

The"authorities"<sic>did? When was this? <snicker> Did the Athens, AL
ppolice catch you slurping nutsacks of winos again, lllardasssss Llllloyd,
N0VFP, the
unidentifed hillbilly-like voiced QRMer of 20 and 75 meters?

>or would you rather have us post it here
> unedited? because I am sure you will not be truthful with us.

Post it, fuckwit. Bwhahahahahahahahahahahahahahahahaha

Let's review one of Lllllllllllllllllllardassss
Lllllllllllllllllllllllllllllllloyd's arrests:

The Great Pumpkin
Birmingham Post-Herald
October 14, 2000

Police arrested Lloyd A. Davies, a 27 year old white male, resident of
Athens, Alabama in the Anderson Pumpkin patch at 11:38pm Friday. Davies
will be charged with lewd and lascivious behavior, public indecency,
and public intoxication at the Athens Municipal Courthouse Monday. The
suspect allegedly stated that as he was passing a pumpkin patch, he
decided to stop. "You know, a pumpkin is soft and squishy inside, and
there was no one around here for miles. At least I thought there
wasn't." he stated in a phone interview from the Athens Municipal
Courthouse Jail.
Davies went on to state that he pulled over to the side of the road,
picked out a pumpkin that he felt was appropriate to his purposes, cut
a hole in it, and proceeded to satisfy his alleged "need". "I guess I
was just really into it, you know?" he commented with evident
embarrassment. In the process, Torrance apparently failed to notice the
Athens Municipal police car approaching and was unaware of his audience
until officer Brenda Taylor approached him. "It was an unusual
situation, sure." said officer Taylor. "I walked up to (Davies) and
he's... just working away at this pumpkin."

Taylor went on to describe what happened when she approached Davies. "I just went up and said, 'Excuse me sir, but do you realize that you are screwing a pumpkin?' He got real surprised as you'd expect, and then looked me straight in the face and said,
'A pumpkin? Damn... is it midnight already?"

Poor Llllardasssssss Lllllloyd, and he has other arrests because he was caught slurping nutsacks behind dumptsers.
That new church hasn't helped you, has it manic depression FATASS Lllllllllllllloyd?

That was an excellent argument, Hans. I enjoyed reading it.

I was referring to a specific plank, Cecil. Republicans and Democrats have planks that are "specific" to certain issues. I've never seen a specific plank in the Libertarian Party that referenced CW testing (or did I miss it). The statement that you made above may be a "general" view of the party, but it certainly does not address the issue of Morse testing since many still believe that it is a necessary requirement. I'm sure there are a lot of Hams who espouse the views of the Libertarian Party in general, but who still think Morse testing should continue; or do you think every last Libertarian is against it?

Great food for thought, Hans. Circular reasoning would then seem to be
at the core of Objectivism. In other words, you must also be able to
deduce the premise from the conclusion. So as long as the logical chain
is unbroken, internally self-consistant, and returns to the original
premise, the conclusion is considered to be true whether or not the
premise is true.

The name given to this form of reasoning, 'Objectivism', seems to be a
kind of double-speak. It attempts to ensure the perception of
objectivity which may otherwise be lacking. It's greatest virtue being
apparently that it allows one to feel good about himself.

By the way, Hans. Your emailbox has exceeded it's disk allotment.

Translation:

"Here is the opinion on which my fact is based."

Leaky logic, Cecil. Really leaky.

Ignoring the blatant untruth "Let me repeat", since your
original statement didn't include the qualifying clause "It is
my opinion", it seems that the term "logical consistency"
has not been translated into Texan.

With all kind wishes,

de Hans, K0HB

"The very arrogant and the very stupid have one thing in common.
Instead of altering their views to fit the facts, they alter the
facts to fit their views... which can be very uncomfortable if
you happen to be one of the facts that needs altering."

What's funny to me is that Dave H. is so "upset" (waaaaaaa) about this lady who sent him a letter outlining his responsibilities as a ham. Yet, he constantly makes attempts to tell me what my responsibility is as a ham... Go figure.

Oh yuck...she's got such a dry sense of humor (though I like her
interpretation of a man's penis as a heat seeking missile). I'd be played
by the gal who plays Dharma. Or, Mimi, on Drew Carey. Yeah, kind of in
between those two.

"Always"??? Don't think so! You have consistantly berated anyone who saw any true value in CW as a Luddide. Of course that's what we've long ago come to expect from you- conversation from both sides of your mouth.

It's obvious, isn't it? No mode that came before FEC was ever a serious mode, in his view. I'd say he's probably alone out standing out in his field on that one, but there he is.

To the contrary, Dick. If you'd raise your reading comprehension to
understable, you'd realize that the reaction to the proponents of CW have
not been against the mode--they have been against the sneering from you
toward those of us who don't care for the mode. So, in contrast to your
opinion of yourself, you don't love freedom for all--you love freedom only
for people like yourself.

The idea is that at the bottom of the bands there is a CW-only segment. Then
there is a CW/digital shared segment. Then the 'phone subbands as we know them.

"digital" means RTTY, PSK31, PACTOR, you name it.btw, the rules need to change
so that occupied bandwidth is the deciding factor, not "symbol rate". What
matters is how much band a mode takes up, not how fast it is.

The old subbands-by-license-class stay, as long as there are Advanceds to need
them.

>What about 3675-3725 Novice "CW only"?

Moves and is expanded to match Tech CW/digital.

>> Techs get 3550-3650, 3925-4000

Sorry it wasn't clear. Some may argue that Novices should have CW-only. That
makes some sense because otherwise there is no HF incentive to take Element 2.

The basic idea is to give Techs a serious amount of HF/MF, not just tiny
slivers of a few bands.

Hope I cleared it up.

The main point is the concepts. Details follow from them.

I don't even know what a Luddide is and have never used the word. The people I have berated, including yourself, are the people who see supernatural value in CW and worship the Morse Code Creed. CW is my favorite mode but it does not possess supernatural powers. CW deserves to be judged upon its real world merits which are many.

For years, I have consistently advocated freedom of choice of modes which includes the freedom to learn Morse code or not.

Why should I be the only poster required to state that it is
my opinion? Virtually everything posted here is someone's
opinion. If you like, I can gather the names of some digital
communications experts who will agree that it is a fact that
a digital mode without FEC is a poor choice for HF RF.

Please don't distort the meaning, Dick. RTTY was a serious digital mode
50 years ago. It is not today. At the present time, any HF digital mode
lacking forward error correction is not a serious mode. Do you think the
military uses FEC on their digital communications or not? Do you think
the military is serious about digital communications?

You deny badmouthing digital methods and in the very next sentence you badmouth
digital adaptive filtering. Digital adaptive filtering methods are as good as
they are. I have not exaggerated their capabilities.

Absolutely untrue, Jim. Ayn Rand started with a few axioms, just like geometry does. She built the Objectivist Epistomology along the same structure as geometry.

A couple of the axioms that I remember are: Existence exists and consciousness is conscious. One has to start somewhere. You cannot prove the existence of a point yet most of your mathematics is based on the existence of a point. Nobody has proven the existence of a supernatural yet the great majority of human beings allow the concept of a supernatural in one form or another to rule their lives.

They present arguments concerning subjects on an objective basis. Here
is an axiom: Existence exists. Are you going to argue that axiom is
not objective? Are you going to argue that it is false?

Hans:

Without hair, I'd look more like Telly Savalas than Carroll O'Connor.
However, the late Mr. O'Connor was a very distinguished actor, and
I would have been proud to have been portrayed by him -- our political
differences aside.

Hans:

What is the basis for this statement? Have there been any specific statistical studies made correlating IQ to religious beliefs? If so, could you provide some references? If not, are you saying that it is your own personal observation that people who believe in God tend not to also possess high intelligence?

My IQ was tested many years ago at 156. I believed in God then, and I believe in Him now. Some of the world's greatest scholars, in virtually every academic discipline, are or have been clergymen representing all faiths. How would you account for that?

One kilopardon requested, Ed! Your request that Woody be cast as your own good self is approved!

I also counted on my fingers and toes, and determined that I also forgot Hans Brakob, who I suggest be portrayed by John M. Jackson.

And speaking of lawyers (or those who play them on TV), I suggest that Phil Kane be portrayed by Ray Walston.

Casting seems to be complete; now all we need is a plot. Any suggestions?

Every last real Libertarian is against it. Like any other party, there are
lunatics in the Libertarian party. The FCC has said that the only reason
to keep a Morse code exam for amateurs is the treaty. All true Libertarians
would agree with the FCC on that one issue.

Seems to me the better operator starts out with reasonable power and then
increases it if he is getting no contacts or poor signal reports. That
doesn't
mean starting at QRP levels... Seems a reasonable starting point would
be 100 watts (typical HF transciever output).

As Ed Hare (ARRL) noted along with others, the government
just doesn't work that way.

> With approximately 700k licensed US amateurs it wouldn't be a

The ARRL is free to "poll" all hams anytime they want. The cost to do
so is probably prohibitive.

> (After all, the database is finite and
> a time limit to respond could be set.) The results of which could then
become
> the single largest petition the FCC has ever received. (One way or the
other.)

Which, again, the ARRL is free to undertake anytime. You'll
need to convince ARRL of doing it.

Cheers,
Bill K2UNK

You amaze me with your ability to frequently misinterpret what others have written. You do it with what I write so I have little doubt that you'd do it with the writings of Ayn Rand. I don't believe that it is impossible to tell the meanings of writings after the author dies. I believe that it is impossible to tell what someone thought about an issue he or she never wrote about while living. You aren't discussing what was written, you're discussing that which was never written.

DICK!
It isn't about how good or bad or indifferent CW is... The ISSUE
is the continued need to test prospective HF hams for morse
skill. Cecil has already stated how much he uses CW, others have
also. The use of CW by hams does not constitute any need to test
ALL prospective HF hams in the skill itself on an exclusive pass/fail
basis.

NCI has NO say one way or the other regarding the ARRL polling
every licensed ham. The point I have made is that the FCC doesn't
limit itself and has always relied (correctly IMHO) on interested
parties filling their comments.

> The MAJORITY of those who commented on 98-143 wanted AT LEAST 2 code
> test speeds, but the FCC ignored them. (This is according to an NCI
> count of the comments, too!)

You keep forgetting that the final decision is driven by public policy
considerations, not simply the majority opinion of licensed hams.

> Consider that NCI membership consists of, at most, a few thousand
> folks who have bothered to click a few buttons on the website. No
> dues, no expiration, no removal from the rolls unless the member
> specifically decides to unjoin.

Or, as I have noted, if the person comes up "missing" via email.

> The way things are going, I'd be really surprised if S25.5 survived
> WRC 2003. You can expect code testing in the USA and several other
> countries to disappear shortly thereafter.

Agree on WRC 2003 and we (NCI) will be right there to help push
the end of code testing in the USA and elsewhere once S25.5 is
gone.

> The interesting question is - what then for NCI once their avowed job
> is done?

Who knows. That'll be up to the BOD of NCI.
Conspiracy theory folks are free to let their imaginations
run amok on the possibilities :-)

Bill,

Before inserting the other brogran into your yap, you should really query Bob if you don't like the information you've gotten from Hans or that which I'm about to provide. With regard to the first URL you've provided, the only hand mike described with an electret element is the one for Icom radios (with the Icom electret element). With regard to the second URL, the adverstiser made an error. Click on the photo of the HC-4 and HC-5. Read down the page until you see (under specifications) that the elements are *dynamic*. Did you happen to notice how strange it is that these supposed electret elements require no polarizing voltage?

Think about WHY.

CW/tube transmission was demonstrated to them in the Transatlantic Tests and the 1923 transatlantic QSOs.

>Today, they can't exchange spectrally efficient
>digital-voice techniques for the scheme of allocating repeater pairs that sit
>idle 95% of the time.

Sure they can. They just don't want to because they don't have a clear path to follow. No demos.
>
>Why the difference?
>
For one thing, there is an ENORMOUS installed repeater infrastructure.

For another, homebrewing (as in building a rig from the ground up) has dwindled to a small percentage of ham stations. When the Ancient Ones wanted to get on the air with a new mode, they BUILT their rigs from scratch. Not just a few pioneers - almost everybody did it. That sort of thing decreased after WW2 and now is the exception rather than the rule.

The digital voice articles in QST are a start. But there needs to be a series of practical how-to articles on getting started. Look at the QSTs before about 1970 - lots and lots of articles on getting started.

Yet another reason is the mindset that 2 meters MUST be where things happen. Is 222-225 all full of repeaters? How about 900 MHz?

Finally, what we don't see is a frank, clear picture of what people think the way forward should be. What's the solution - force repeaters off the air?

I get it now. If they agree with ending Morse testing, they are "real"
Libertarians and if they don't, they are "lunatics". Thanks for clearing
that up.

Actually Arnie, before the creation of the FCC, amateur radio was administered by the Department of Commerce. This latest from Cecil is just another twist in the road which is his wandering mind.

Why go to all the trouble? Even most experienced hams could tell you that, including yers truly. But that's not what you said. You said no non-FEC mode was a serious mode. That includes all pre-FEC modes. RTTY is still a in use, and is pretty darn good in weak signal conditions. I think it's a serious mode, still, even if not the mode of choice of the digigeek set.

Yeah, that was your excuse then as now, that was my point.
When your geekiness gets to the point that CW at the exact same poer level as
PSK31 will make copy when PSK31 will not, your argument in favor of the "more
efficient mode" is shot to hell, sorry about that.

> You should have tried QPSK at

Guess your memory is shot, too, I was copying only, or attemptinjg to print, a
group of weak European PSK31 stations on a nearly dead 20 meter band. I wasn't
attempting to work them and couldn't have in any case. But I sure could copy
their CWID's!

So where is the evidence against it? No, I'm not talking about bible or religious credo. It is a bit egotistical for one to state that all this just "happned". That supposes a power within oneself that he really doesn't have. If you do, make yourself immortal.

Oh, we know.....the Shack on the Belt guys, whether NCT or Extra lite, will
do all the parades and get all the press. Locally, that works out fine. But when

things really go in the toilet, when preplanning for an incident just isn't
possible,
the people who get it done are the ones with the most tools available.

So, you are not a proponent of the FCC R&R, Dave? Bill makes the reasonable assumption--possibly based on personal opinion--that a better operator is one that would start with a probable--definitely based on personal opinion--power output of 100W. FCC Regulations require that no power is used than necessary to make the contact. If you're such a perfect--definitely based upon your personal opinion--operator, why don't you follow the FCC R&R? Hmmmm?

Yeah, but see, Cecil. Dave's a "by the book" kind of person. He's never dreamt up anything that didn't go along with what is in black and white. He can't think outside the box. If this Ayn Rand never specifically said that she was against CW testing then, in Dave's mind...well, that's even a little hard for *me* to translate...LOL...but you get the picture? (As black and dark as it might be?)

Which, by the way Dick, are getting worse and worse. Do you like
deliberately no using a spellchecker? Don't you think that written
communication should be as clear and concise as possible, just as in verbal
communication? Or, do you make as many mistakes when you speak, also?

1849. Digital Radio and "Future Systems" (was Re: ARS w/o S25.5 Proposal Proposal)

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-16 12:07:24 UTC
From: w1rfi@aol.com
Message-ID: <20020116070724.13150.00002106@mb-dd.aol.com>
Source record: 31340

Good points all, Jim. I agree with all of them. The biggest reasons that things are not moving forward are social, and, IMHO, groups like ARRL and TAPR need to do more to get the word out. Right now, hams think that "digital" means "computer-to-computer" or "keyboard-to-computer" and that is only one facet of the potential for digital operation.

And the repeater problem is indeed a difficult problem, for the very factor you describe -- the existing infrastructure. If a new trunked system or spread-spectrum system were to be installed, which existing repeaters would be displaced to do it (a contiguous chunk of frequency would be needed), who would decide who gets the axe and how can it be justified in the short term to displace repeaters that are seeing some use in favor of a new system that, though it might be beneficial in the long run, in the short run would see virtually no users because of the lack of off-the-shelf equipment for ham radio.

A demo would help, but the only bands that I think could be initially used without affecting existing users would be 900, 1200 or 2400 MHz. And demo or not, those bands, too, have the problem of the lack of existing equipment.

I will have to check with Doug Smith (Ten Tec, QEX Editor, chairman of the Digital Voice Committee) to see if the committee is considering any of these issues. Right now, they are working on trying to identify which vocoding schemes are best for ham radio, HF and above. Alinco, btw, has added a digital voice option to one of its HTs. We have a couple of units in the Lab and are getting ready to test them.

>babbling about, do you? Is this the reasoned voice of an NCI Director?

I don't think he was speaking for NCI. Do you? If someone works for General Motors, are you going to ask them if they are the reasoned voice of General Motors if they are posting on a subject not related to automobiles? In what way do you think that his opinion that 100 watts represents a reasonable minimum level to obey the FCC rule on "minimum necessary power" to be a statement of NCI policy? As an aside, can you cite any examples where the FCC has cited anyone for using 100 watts where 5 watts would have worked?

As to the babbling, if you could explain what you think is wrong about his post, instead of calling it babble, you would not be babbling yourself...

Seems it couldn't also be 40 meters at 10 am. Still, all in all you haven't a clue as to propagation effects. The original statement stands, chances are he was working Europe at that time, it would make the most sense needed the power to get a reasonable signal into the continent.

See above. So let me get this straight MR EXTRA class license. IF you BILL SOHL can't hear anything, the bands aren't crowded? Did I get the right?? You must have one of those W3LPL type stations or one of those WA2VUY type stations that allow you to hear anything on the fillings of your back teeth. Wow, you must have at least 389 countries confirmed at this point. Can I come over and use your station when the P5 comes back up. Better yet, when Dave Heil gets on, let me know and I can work him. I need WVa on 30m ssb

Forgot me, but then again there isn't anyone I look like at all that is famous in any sense of the word. Look me up on Qrz.com and see if you think I resemble anyone.....

(I personally do not believe anyone else could be that ugly! :)

20,000 plus newsgroups are on usenet. The semi-anonymous nature of Usenet is what makes it so great. Yet, the amateur radio newsgroups are the only ones that have people who want you to "identify" yourself. Usenet is not amateur radio, and therefore, does not require that I post a callsign.

Shape factor may be imporved on some rigs.

>On CW, one can narrow up the bandwidth from the
>typical 500 Hz bandwidth in today's rigs to about 100 Hz, using either an
>internal or an outboard filter.

Yep. 500 Hz is the widest that should even be considered. Cascading filters helps, too.

> This can be either analog or DSP -- the
>effect
>will be the same.

Not as a general rule.

One of the most neglected factors is AGC. Too many hams and rig makers think that AGC is so necessary that they never turn it off. In my experience, AGC on a crowded band increases the apparent interference.

Suppose I have a receiver with a 500 Hz IF filter that has 4:1 shape factor. I'm trying to listen to an S5 signal when an S9 + 10 db signal shows up 600-700 Hz away. The interfering station takes over the AGC and drives the S5 station into the noise, even if I zero-beat the interfering station.

If I turn off the AGC, reduce RF and increase AF gain, the S5 station may become readable.

A sharper IF filter can reduce the S9+10 dB station's strength to the point that it no longer takes over the AGC. Audio DSP, or DSP that is not a part of the AGC control, can't do that.

Two really nice features of the K2: You can turn off the AGC, and you can set up the IF xtal filters in a wide variety of ways.

Nope. The appropriate power level is that which will be copyable at the bottom of the fade. Sometimes that's QRP, sometimes it's QRO.

>
>OTOH, there are times when 3 dB more transmitter power

Yup. Or the wetware.

In case you haven't noticed, I'm NOT against high power. I'm for "approrpiate power". If somebody can't hear my 10 watts, they don't have to work me.

>> Then again, I run almost all CW.

If it's loud enough and the noise is such that a blanker can't handle it.

Wrong.

"Reasonable power" depends on the situation. With good conditions and a decent
antenna, 1.5 watts is reasonable power. Under other circumstances 1500 watts is
reasonable power. And of course there are all sorts of variations in between.

>> This can be either analog or DSP -- the
>> effect will be the same.

>Not as a general rule.

In the context of the discussion, the effect will be the same. I was addressing the statement that some hams don't want to have to run high power to overcome noisy conditions on the other end. I was thinking of local noise -- power line and such, and under those circumstances, receiver ACG and dynamic range are not apt to be factors. Under those circumstances, bandwidth is bandwidth is bandwidth, for the most part.

>One of the most neglected factors is AGC. Too many hams and rig makers think
>that AGC is so necessary that they never turn it off. In my experience, AGC
>on
>a crowded band increases the apparent interference.

Yes, and in the presence of strong signals elsewhere in the band, filter placement makes a BIG difference.

And, from our experience, most rigs today DO allow one to turn off AGC. In some cases, one has to drill through a menu or two, or hold the AGC button for 5 seconds or such, but it usually can be done. If it can't, ARRL Product Review testing has to measure gain compression with the AGC on, and that does NOT help give good dynamic range numbers. :-)

Not necessarily. It depends on whether one is willing to accept brief periods of lost data. Lost data can be recovered, with forward-error correction or repeats.

Some of the low-power communications I have done have relied on just the opposite effect. I expect to get through on only signal peaks. I will point out that I haven't worked Hans with 10 milliwatts on HF yet. :-)

Yeah, right the bands nearly dead you could have worked them using QPSK.
But, no.... this wouldn't be 'in line' with your adgenda.

MCW is much wider than normal CW and can be heard when CW can't why don't
you use that mode? I'll tell you why because it's illegal that's why.

You even use and recommend the illegal MCW. In HF MCW is only legal in the
"CW, phone, image" subbands. It's illegal in the "CW, RTTY, and data"
subbands.

My original point was a rebuttal, of sorts, to Steve, K4YZ's
proposal:

>> To go one further, I would support an overall
>> regulatory reduction in our authorized power levels
>> to NO MORE than 500W PEP on 160, 80 and 40, and no
>> more than 250W on the rest of our allocations,
>> including UHF and above.

The term "appropriate power" implies that power level
will be at the discretion of the operator. By limiting
the upper range of that power level control by government
fiat means that, in some cases, an inappropriately low
power level will be mandated by law. I would prefer that
not be the case.

K7JEB:

>>A light-
>>dimmer swishing across a 250 Hz bandwidth at a 120 Hz
>>rate will still destroy a QSO that could be had if
>>limited only by the quiet atmospheric noise of a
>>winter's night.

N2EY:

> If it's loud enough and the noise is such that a
> blanker can't handle it.

These little goodies are more like "birdies" -- the
high harmonics of a free-running oscillator in the
10's of kHz range used to "touch-sense" for a light
dimmer. It's very much like a frequency-modulated
signal and totally immune to noise-blanking. Or
they might be the unfiltered harmonics from a switching
power supply used to regulate the brightness of lawn
lights. Or....

Notice how I have been able to successfully hijack
a .policy thread into a technical discussion. ;-)

Sorry to jump in on this but, this discussion reminds me of this story.

Religion 101...

One day a 6 year old girl was sitting in a classroom. The teacher was
going to explain evolution to the children.

The teacher asked a little boy: "Tommy do you see the tree outside?"

TOMMY: Yes.

TEACHER: Tommy, do you see the grass outside?

TOMMY: Yes.

TEACHER: Go outside and look up and see if you can see the sky.

TOMMY: Okay. (He returned a few minutes later) Yes, I saw the sky.

TEACHER: Did you see God?

TOMMY: No.

TEACHER: That's my point. We can't see God because he isn't there.
He doesn't exist.

A little girl spoke up and wanted to ask the boy some questions. The
teacher agreed and the little girl asked the boy: "Tommy, do you see
the tree outside?"

TOMMY: Yes.

LITTLE GIRL: Tommy do you see the grass outside?

TOMMY: Yesssss (getting tired of the questions by this time).

LITTLE GIRL: Did you see the sky?

TOMMY: Yesssss

LITTLE GIRL: Tommy, do you see the teacher?

TOMMY: Yes

LITTLE GIRL: Do you see her brain?

TOMMY: No

LITTLE GIRL: Then according to what we were taught today in school,
she must not have one!

I not only recall the FCC citing anyone for using 100 when 5 watts would
have worked, I can't recall the FCC citing anyone for using 1500 watts
where 5 watts would have worked.

> As to the babbling, if you could explain what you think is wrong about his

Here are some numbers to think about. These are the number of unexpired
FCC ARS licenses held by individuals on the dates listed:

As of May 14, 2000:

Novice - 49,329
Tech - 205,394
Tech Plus - 128,860
General - 112,677
Advanced - 99,782
Extra - 78,750
Total - 674,792

As of January 14, 2002:

Novice - 40,117 (decrease of 9,212)
Tech - 234,661 (increase of 29,267)
Tech Plus - 84,957 (decrease of 43,903)
General - 138,687 (increase of 26,010)
Advanced - 86,502 (decrease of 13,280)
Extra - 98,119 (increase of 19,369)
Total - 683,043 (increase of 8,251)

Given that 99% of emergency communications is practice drill the answer would be
whatever the local hams want to use. There is no question that most "support"
comms are done on 2meter FM. So I guess we should just ignore the widearea
disasters where 2meter FM is useless, and HF SSB ineffective due band conditions
(a particularly common situation in hurricanes which are one of our most common
disaster threats).
We won't mention the West Coast "Big One" that scientists keep telling us is
coming.

Makes sense when you understand were Bill comes from - the broadcast indstry where sounding good is important. To many hams that isn't as strong consideration as "punch" to get through QRM. Of couse that doesn't excuse the transmitter mismanagement Bill notes. It does demonstrate that fact that lots of hams are putting transmitters on the air without knowing enough about what they're doing.

No, I can't. I'm sure there are many I haven't tested, or even heard of. Have youU? If not, why not? that's part of your job at the lab, isn't it?

But I'd wager that some are good and some are not, just as almost every other manufactured device.

There are advantages to trunked systems *in some usage cases*. It is difficult to imagine a ham radio where those advantages would come into play. In a ham radio where most repeaters remain quiet nearly around the clock daily, I see no advantage whatever to being able to set up special access groups, which is used to advantage in law enforcement as an example. What I DO see is a lot of costly complexity for the sake of itself, "modernizing" for its own sake.
And in a environment where you state serious concern about spectral problems causecd by all the Part 15 devices it's difficult to imagine anything but more insidious elevation of the noise floor by universal adaption of spread spectrum. I know that I once did a lot of work tracking unintentional a wideband random noise generator that would wipe out a lowband VHF receiver which was used in a crossband Public Safety repeater. The signal would disappear in midsentence, taken out by noise which would activate the limiter but not open the squelch. Took some detective work, but I finally found the source, a machine shop about a block away that used very noisy power tools at random times, and it was such that it caused the repeater to be relocated to a less noisy area. This was in a tiny rural village, too not a metropolitian area. I can imagine what countless intentional noise sources might bring to the ARS in high density popupation centers. I expect it's coming.but I don't have to like it - nor support it.

What we need here Larry is a backbone story that will let us do skits and schtick. My first choice was something like the old Andy Hardy movies where Mickey Rooney and Judy Garland alternated saying "I know, let's put on a show!". But I think a better model is an old Randolph Scott epic I believe called Fort Worth in which people who never met in real life and in fact were not even alive at the same time rode thru town. Envision the following:

Stroll over to the saloon where Kim is spoofing the Madlyn Kahn in Blazing Saddles spoof of the Marlene Detrich performance in Destry Rides Again.

Down at the village blacksmith shop, one Larry Roll recites "Under the Spreading Chestnut Tree the Village smithy stands, the smith a big fat slob is he with dirty arms and hands." while Carl reprises, Under the spreading chestnut tree the village smithy snoozes, no horse since 1926 has come to him for legacy shoeses."

Down at the livery stable, Hans sings, "And I polished up the apple so care-ful-ly that now I'm the ruler of a Big R-V"

Over at the Opera House Jim has to be physically restrained from singing Springtime for Hitler and in the repertoire performance of the Sound of Muzak, like the Mother Superior in the original gets this glassy-eyed look and begins to bellow, "Build your own hardware, build every piece, follow every wild hair, til life itself should cease'.

Cecil is in the Men's Room I mean meeting room of the local Mensa chapter where a riot has begun and Cecil is beating hell out of all and sundry with a Funk and Wagnalls.

Dick is chairing a meeting of the planning commission in the Historical Society building trying to finalize the plan from three years ago. Ed is waiting to present next year's plan which Jon has put on a CD rom for which the planning commission has no player.

At the theatre, I am doing Mark Twain (which I believe Sam Waterston has done) to thunderous applause. Hey, this is my vision isn't it.

And the surface has yet to be scratched.

Dick N&#65533;BK

Dick, ask the military if they think RTTY is a serious mode. And RTTY
is NOT pretty darn good in weak signal conditions. It sucks under
weak signal conditions.

Uhhhhhh Dick, "critical" is "serious". For conversational purposes
those two words are interchangeable. From Webster's:
"serious - having possibly dangerous consequences"
"critical - characterized by risk"

Wouldn't you agree that depending only on RTTY during an emergency is
characterized by risk and may have possibly dangerous consequences?
You have said as much in the past.

Like any other statement I make, it means that well-designed adaptive filters
work great when applied to a problem suitable for solution with well-designed
adaptive filters. Adaptive filters will not fix a flat tire. Are you capable
of anything except carping?

I keep telling you, Dick, you need a digital mode with FEC. HF is notorious
for phase shifting an RF signal. Obviously, a mode that depends on phase
and has no error correction is going to fail under those circumstances.
The human ear is relatively immune to phase shifts encountered using CW.
If you had been using PACTOR II in a QSO, things would have been reversed.

God would like to thank you for your belief and patronage. In order to
better
serve your needs, He asks that you take a few moments to answer the
following
questions.

Please keep in mind that your responses will be kept completely
confidential,
and that you need not disclose your name or address unless you prefer a
direct
response to comments or suggestions.

1. How did you find out about your Deity?
___ Newspaper
___ Bible
___ Torah
___ Book of Mormon
___ Koran
___ Divine inspiration
___ Dead Sea Scrolls
___ My mama done tol' me
___ Near-death experience
___ Near-life experience
___ National Public Radio
___ Tabloid
___ Burning shrubbery
___ Other (specify): _____

2. Which model Deity did you acquire?
___ Yahweh
___ Father, Son & Holy Ghost [Trinity Pak]
___ Jehovah
___ Jesus
___ Krishna
___ Zeus and entourage [Olympus Pak]
___ Odin and entourage [Valhalla Pak]
___ Allah
___ Satan
___ Gaia/Mother Earth/Mother Nature
___ God 1.0a (hairy thunderer)
___ God 1.0b (cosmic muffin)
___ None of the above; I was taken in by a false god

3. Did your God come to you undamaged, with all parts in good working order
and

with no obvious breakage or missing attributes?
___ Yes
___ No
If no, please describe the problems you initially encountered here. Please indicate all that apply:
___ Not eternal
___ Finite in space/Does not occupy or inhabit the entire cosmos
___ Not omniscient
___ Not omnipotent
___ Not infinitely plastic (incapable of being all things to all creations)
___ Permits sex outside of marriage
___ Prohibits sex outside of marriage
___ Makes mistakes (Geraldo Rivera, Jesse Helms)
___ Makes or permits bad things to happen to good people
___ When beseeched, doesn't stay beseeched
___ Requires burnt offerings
___ Requires virgin sacrifices
___ Plays dice with the universe

4. What factors were relevant in your decision to acquire a Deity? Please check
all that apply.
___ Indoctrinated by parents
___ Needed a reason to live
___ Indoctrinated by society
___ Needed focus in whom to despise
___ Imaginary friend grew up
___ Wanted to know Jesus in the Biblical sense
___ Graduated from the tooth fairy
___ Hate to think for myself
___ Wanted to meet girls/boys
___ Fear of death
___ Wanted to piss off parents
___ Needed a day away from work
___ Desperate need for certainty
___ Like organ music
___ Need to feel morally superior
___ Thought Jerry Falwell was cool
___ My shrubbery caught fire and told me to do it

5. Have you ever worshipped a Deity before? If so, which false god were you fooled by? Please check all that apply.
___ Mick Jagger
___ Rajanish
___ Baal
___ The almighty dollar
___ Bill Gates
___ Left-wing liberalism
___ The radical right
___ Ra
___ Beelzebub

___ Barney T.B.P.D.
___ The Great Spirit
___ The Great Pumpkin
___ The sun
___ Elvis
___ Cindy Crawford
___ The moon
___ TV news
___ Burning shrubbery
___ Other: _____

6. Are you currently using any other source of inspiration in addition to God?
Please check all that apply.
__ Tarot __ Lottery __ Astrology
__ Television __ Fortune cookies __ Ann Landers
__ Psychic Friends Network __ Dianetics __ Palmistry
__ Playboy and/or Playgirl __ Self-help books __ Sex, drugs, rock and roll
__ Biorhythms __ Alcohol __ Bill Clinton
__ Tea leaves __ EST __ CompuServe
__ Mantras __ Jimmy Swaggert __ Crystals (not including Crystal Gayle)
__ Human sacrifice __ Pyramids __ Wandering in a desert
__ Burning shrubbery __ Barney T.B.P.D. __ Barney Fife
Other:_____

7. God employs a limited degree of divine intervention to preserve the balanced
level of felt presence and blind faith. Which would you prefer (circle one)?

a. More divine intervention

b. Less divine intervention

c. Current level of divine intervention is just right

d. Don't know...what's divine intervention?

8. God also attempts to maintain a balanced level of disasters and miracles.
Please rate on a scale of 1 - 5 his handling of the following

(1=unsatisfactory, 5=excellent):

Disasters:
flood 1 2 3 4 5
famine 1 2 3 4 5
earthquake 1 2 3 4 5
war 1 2 3 4 5
pestilence 1 2 3 4 5
plague 1 2 3 4 5
spam 1 2 3 4 5
AOL 1 2 3 4 5

Miracles:
rescues 1 2 3 4 5
spontaneous remissions 1 2 3 4 5
stars hovering over jerkwater towns 1 2 3 4 5
crying statues 1 2 3 4 5
water changing to wine 1 2 3 4 5
walking on water 1 2 3 4 5
VCRs that set their own clocks 1 2 3 4 5
Saddam Hussein still alive 1 2 3 4 5
getting any sex whatsoever 1 2 3 4 5

9. Do you have any additional comments or suggestions for improving the quality
of God's services? (Attach an additional sheet if necessary.)

If you are able to complete the questionnaire and return it to one of our conveniently located drop-off boxes by October 31 you will be entered in the One Free Miracle of Your Choice drawing (chances of winning are approximately
one in 6.023 x 10 to the 23d power, depending on number of beings entered).

Just proves my point. Virtually all intelligent people know that a
negative cannot be proven. The question is: How can you give
yourself permission to believe in something based on an *absence*
of evidence? There is an absence of evidence that someone named
Dick Carroll lives on Mars. So is there someone named Dick
Carroll living on Mars? If you have enough faith, will that
make it so?

I have read virtually every word that Ayn Rand ever wrote. I have attended her lectures. I have chatted with her over a glass of wine. I have patterned my life based on her principles. It is my educated opinion that she would have been against Morse code testing and that all true Libertarians are against it. I would be pro Morse code testing if it were not for my Objectivist principles which were established by Ayn Rand.

Some are good and some are not.

I bought one of the expensive CW filters for my Icom. Doesn't seem to work,
as the CW is coming through even better than before I installed the filter.

How could the founder of Objectivism be less than objective?

Morse code testing is the ultimate result of the interstate commerce
provision in The Constitution. The legal reason that the FCC gets to
control amateur radio is the interstate commerce provision.

But the 'founder' wasn't doing the 'presuming'. You were. How can that be objective? I believe you told us the founder never expressed an opinion about Morse code.

I'm surprised that a person like yourself is ignorant of the interstate commerce provisions in The Constitution. General aviation is controlled by the feds under the provisions of interstate commerce. Amateur radio is controlled by the feds under the provisions of interstate commerce. Thus the Morse code exam exists because of the interstate commerce provisions in The Constitution. And thus Jefferson and Adams agree in principle through their acceptance of the interstate commerce provisions.

I'm wrong. QSL is, indeed as you have stated, properly used within a CW QSO to indicate understanding. My confusion apparently springs from looking at a QSL as a confirmation of a QSO. All that reasearch just confused me and the issue until my Monday night buddies walked me through it one more time.

I also heartily apologize for the "Sorry, Cecil" greeting on my original message. Looking back on it, it was smart-alec, though if I had been "saying" it face-to-face, I don't think it would've come across that way.

Dick Carroll wrote

> So where is the evidence against it? ....
> It is a bit egotistical for one to state that all this just "happned".

In all seriousness, I can't find any evidence either "for" or "against", which is why I call myself agnostic (not atheist). I'll continue to search.

My natural inclination is to look at things in terms of "cause and effect" (i.e.., "deterministic") fashion. Thus, I share your mindset that all this didn't "just happen". Supposing for the moment that I had a monstrous Cray computer which could explain today's universe completely in terms of its state a billion years ago. I would really have accomplished nothing useful, except to move the mystery back a billion years. Then I suppose I could use my Cray to explain that state in terms of a billion years earlier, and so on, but the chain of cause and effect would go on and on until I'd reach an impasse -- a point beyond which my computer could not penetrate.

The issue then becomes whether or not some supernatural act is needed to kick-start the whole thing, from whence the "laws of physics" go into effect, and my giant Cray computer can apply those laws (Heisenberg notwithstanding) to reach our current state of the universe..... .....and continue forward to infinity and beyond, to quote Buzz Lightyear.

Unfortunately, that deterministic scenario is distinctly unattractive to religion, because it places god in the position of just "throwing a switch" and then having his role reduced, as Ilya Prigogine puts it, to "a mere archivist turning the pates of a cosmic history book already written".

I'll keep searching.

Objective?? How does Objectivism explain her personal behavior.

For many years Ayn and her follower, Nathaniel Branden, were involved in love affair that they kept secret from everyone except their respective spouses. By their reckoning the affair was ultimately "reasonable" since the two of them were, de facto, the two greatest intellects on the planet. Rand states (to her husband and Branden's wife) "By the total logic of what love and sex mean -- we *had* to love each other." Amazingly, both spouses bought into this line and agreed to allow Ayn and Nathaniel and afternoon and evening of sex once a week.

Then later (after their affair had fizzled) Branden became involved with another woman. Even though the affair was a decade in the past, the master of the absolute moral double standard would not tolerate such a breach of conduct by anyone else. She was furious, broke all ties with Branden, and declared to her followers that the excommunication was because of "ugly actions and irrational behavior in his private life, which was grossly contradictory of Objectivist morality." His second affair was judged immoral, his first not.

That seems decidedly less than objective!

Apparently her cult thought so too, because the organized Objectivist movement pretty much imploded after that.

>...
>Yet another reason is the mindset that 2 meters MUST be where things happen. Is
>222-225 all full of repeaters? How about 900 MHz?

In my area, not only has 222MHz been filled with repeaters, until recently (about 1-2 years ago), there was still a waiting list for relocation of repeaters that got displaced when we lost the 220-222MHz segment. I believe that every repeater pair had a minimum of 3 co-channeled systems, with some having up to 6 or so.

Local Bandplan (Southern California):
222.000 - 222.015 Weak signal and non-FM modes
222.016 - 223.380 Repeater Inputs
223.400 - 223.520 FM Voice (Simplex)
223.540 - 223.700 Digital/Packet
223.720 - 223.740 Control Inputs/Misc.
223.760 - 224.980 Repeater Outputs

See http://www.220sma.org/ for greater detail.

As for 33cm (915MHz), that is a wasteland here. Cordless phone interference and that from other licensed users (905-912MHz and 918-925Mhz) higher up in the hierarchy (i.e. those services amateur radio is secondary to for this band) give us very little to work with.

For trunking, 900 is more likely than the others, since there is equipment on
the 800/900 business/public-safety bands for this. However, cost is another
issue.

In my area, there might be some parts of 1200 open, but there's alot taken too.
Furthermore, the equipment that exists there is "traditional" amateur
equipment. It's not feasable to use this band.

For 2400, kill all the non-spread-spectrum part 15 devices off, and maybe SS
could work there. As I have noted earlier (last year), some cordless phones
operate up there as NON-SS, FM Wideband where wide means >1.5MHz. SS cannot
overcome such a signal unless it can hop outside of it.

I don't know about educated but it certainly seems to be your opinion so
you're stuck with it. You've based your opinion on morse testing on a
guess at what Ayn Rand might have believed had she ever considered it.
It is my opinion that you are a flake.

>Carroll living on Mars?

There is accepted modern physics that says that until it is observed whether there is a Dick Carroll living on Mars, there IS a Dick Carroll living on Mars... and there is not.

Now, if no one has observed a Carl Stevenson on earth enjoying Morse code operation, does the same physics remain true? :-)

So, if you think that testing for the Amateur Radio Service should be based on the need for emergency communications, can we presume that you feel that they should be tested on whatever they want to use? :-)

>talking about the need for change in a regulation which he doesn't
>understand?

In what way is Bill's opinion about what power level represents a reasonable
starting place to follow the rule to use the
minimum necessary power?

I agree with Bill. If one were to start with 100 watts of power on HF, that
would be a reasonable place to start. If I were going to try an afternoon of
hamming and didn't want to torture other hams with QRP, I would run barefoot
and if I were making QSOs, I would probably be happy.

How do you approach meeting the requirement to use the minimum necessary power?
What power do you generally start with?

How many places can Larry be in? He is down at the smithy and shooting
holes in CDs. Personally, I think he is more likely to be down at the
saloon putting holes in the ceiling and yelling "Put it back on!"

I think you meant to say that you *don't* recall the FCC citing anyone for
using 100 watts when 5 watts would have worked/1500 watts where 5 watts
would have worked. Is that what you meant? Why would that matter, Dave?
It is in the R&R and we are a "self-policing" entity--one left with trust to
behave ourselves and to be the "eyes and ears" for the FCC. Do you advocate
breaking the rules just because no one has been cited for breaking them?
Are you "kind of" saying that it's OK to break the rules as long as no one
is looking?

I don't recall that the FCC has cited anyone for the callsign W5TIT. Yet,
you continuously let me know that it is my responsibility as a ham to treat
the ARS with more respect (paraphrasing--and I'm sure you'll come up with
some lame argument that you never *meant* to say that).

Funny. The more you open your mouth, the deeper your foot sinks in.

Of course you wouldn't. You just professed to being an advocate for
breaking rules as long as no one is looking. Yet, you insist I am wrong for
having a legal callsign. Somehow, Dave, your sense of reason is quite
distorted.

I think you meant to say that you *don't* recall the FCC citing anyone for using 100 watts of power when 5 watts would have worked/1500 watts where 5 watts would have worked. So, you are now advocating that the FCC R&R be violated as long as no one is cited; as long as no one is looking!? Is that really what you are saying, Dave? It sure sounds that way to me. We are a self-policing entity, with the FCC condoning our activity as being their "eyes and ears." It is not meant for us to break the law just because no one's been caught.

You advocate, above, the violation of a US Government Office Rule, yet you remind me constantly of my legal callsign being a disgrace to the ARS [paraphrased by me, of course, and I am sure you'll come up with some lame retort]? You really want to tell me that I am disgraceful, and *you* are not, when you advocate breaking the rules; and I am fully within them?

Somehow, Dave, the more you open your mouth, the deeper your foot sinks in.

> Dave K8MN

Of course you won't. You're too busy telling people who act within the R&R that *they* are disgraceful, when you act disgracefully *and* break the R&R. Phew, go figure.

The same is true of most HF ham transceivers made for the past 40 years.
Collins started that nonsense in the KWM-2, and everybody followed like sheep.

The Kenwood TS-520 was one exception to the rule - you can turn its AGC off.
The TenTec Corsair family, Omni 5 and 6 and I think the Paragon have AGC off,
as do must of the high-end Yaecomwoods.

It sure seems odd that one must spend more money to get an AGC OFF switch.

It would be really interesting to see a list of all the current HF/MF ham rigs
selling for under $2000 that can have the AGC totally defeated. I'll start:

Elecraft K2

Any more?

In my experience it usually CANNOT be done on most of the lower-priced rigs. Care to make a list of the current under-$2000 HF/MF ham rigs with totally defeatable AGC?

> If it can't, ARRL Product
>Review testing has to measure gain compression with the AGC on, and that does
>NOT help give good dynamic range numbers. :-)

It would be nice if the Product Reviews told what rigs have AGC OFF and how hard it is to do. For example, can the AGC be defeated on the FT-817? If so, how is it done?

>though it might be beneficial in the long run, in the short run would see
>virtually no users because of the lack of off-the-shelf equipment for ham
>radio.

And the answer is....??

There's another problem that's even bigger: There is no perception of a driving need to replace good ol' FM with something else. If the repeaters in most areas were all busy 24/7, hams would say "We need to use our spectrum more efficiently". Heck, you don't even need digital - 1980s ACSSB technology will put something like 5 voice circuits where one FM voice circuit exists now!

But if the repeaters are, as you say, idle 95% of the time, the REAL problem is lack of use. The fuss seems to be over replacing an underused FM system with an

underused trunking or SS system.

Let's look at history for a moment. Tube rigs replaced spark because they worked better for less money. Stabilized PDC 1929 rigs replaced their crude predecessors for the same reason. Single signal superhets replaced rationalized autodynes because the increasing crowding made the investment worthwhile. Same for SSB replacing AM. FM/repeater VHF/UHF replaced gooney boxes because the results were so much more consistent. Transceivers replaced separates because they cost less and took up less room.

In each case the new technology offered hams more performance-per-dollar or -kilohertz than what was replaced. The same case has to be made for SS, trunked systems and digital voice. But the case has not been made to the ham community, yet.
>
>A demo would help, but the only bands that I think could be initially used
>without affecting existing users would be 900, 1200 or 2400 MHz. And demo or
>not, those bands, too, have the problem of the lack of existing equipment.

Lack of existing equipment did not stop any of the historical advances I cited. Hams built or adapted. The ham mags were full of how-to-do-it articles. That's where the effort needs to be.

The FCC quoted Kenwood repeatedly in the R&O, but does Kenwood make this stuff for hams now?
>

>schemes are best for ham radio, HF and above. Alinco, btw, has added a
>digital voice option to one of its HTs. We have a couple of units in the Lab
>and are getting ready to test them.

Cool! But that brings up yet another issue:

One of the ways people have discovered ham radio over the years have been hearing hams on the air. Ask a group of hams licensed before about 1963 how they found out about ham radio, and a good percentage will tell of hearing "Fine Business Claude" on the SW band of the family's old Philco radio. Many, many hams were SWLs before they discovered ham radio. The move to SSB reduced this recruiting method greatly.
>
The coming of scanners and VHF/UHF FM ham repeaters revived it for the past couple decades. If we go to digital voice, most of the scanning world won't know we exist.

I'm surprised at the lengths you'll go to. We're not arguing whether
general aviation or morse code testing fall under interstate commerce.
I indicated that we do not know the views of Jefferson or Adams on those
two (and many, many more) things. We'll never know what they thought of
Bill Clinton, the internet or the telephone.

Bye now.

> What power do you generally start with?

Now first, let's add the part of the reg about "to achieve the desired
communication". We need to define the desired communication:

Let's say the P5 shows up on 10m tomorrow evening. I won't want to
torture him with QRP and I'd like to be heard at some point in the
evening's proceedings. I'll start with all the law allows.

Let's say I'm not chasing a rare one. We're on 40m and I hear a SP5
CQing. I'll choose the barefoot rig. Let's say propagation on 40m is
poor and I hear my pal Hannu OH1XX. He is 439. I'm back to all the law
allows. Checking into the section net on 75? I'll opt for the barefoot
rig. Coming back to 75 later in the evening I find that there is heavy
auroral flutter and severe path degradation. I'm back to 1.5 kw.

Please note that I'm not going to 75w, 56.2w or 1235w. At no point do I
repeatedly ask the station I'm in QSO with, "Can you still read me?"
We could easily spend all of our time on the air in performing power
reductions or increases in this manner.

Tell you what: Next time I have time to burn and a rare one shows up,
I'll start by calling him with 50w and steadily increase power in 50w

increments until he responds.

Dick, ask the military if they think RTTY is a serious mode.

So what do you think it is- trivial? Tell it to the military who used it so well for so long. Does that mean it's the mode of choice today? Not at all. Unless it happened to be the only mode available. You ask how that might happen to be? Who knows? Are you omnipotent?

And RTTY

> is NOT pretty darn good in weak signal conditions. It sucks under
> weak signal conditions.
>

As a non-FEC mode it does quite well in my experience. Better than PSK31 in fact. I was once printing a RTTY signal that faded down so low that I could no longer hear it, but it continued to print without error till the signal recovered from the fade. I don't see PSK31 doing any better, and normally not that well.

So what is it that changed your mind? You were singing a completely different tune at that time. Of course we're accustomed to you're changing stories so no surprise.

> Obviously, a mode that depends on phase
> and has no error correction is going to fail under those circumstances.

That wasn't the point. You make a huge deal about how much more efficient PSK31 was over CW. But the CW was readable and the PSK31 was not. You made much of the fact that PSK31 was hugely more efficient than CW anyway. Now your story shifts to "The human ear is relatively immune..." Yep. That's one of the things that makes CW work so well in awful band condx. When there is a trained operator at work, that is.

he human ear is relatively immune to phase shifts encountered using CW.

I think he'd be shooting at the holes in the CDs.

Try to coordinate a repeater that you do want to use in most areas. The answer is generally that all of the pairs are already assigned. That looks like a driving need to me. With better spectrum sharing techniques, and there are several to choose from, the number of "repeaters" in a given area would not be limited by the number of potential users (tie up a pair of frequencies whether they are in use or not), but would be limited by the number of simultaneous users (have some sort of dynamic frequency allocation or other spectrum sharing scheme).

You'd be happy but you're not following R&R, Dave. You enjoy putting yourself up on a pedastal...figuratively making yourself one of the perfect hams. A perfect ham would follow, allow for, and submit to the operating practices as dictated by the FCC.

>

Then, you haven't even tried to see what power level would actually "achieve the desired communication." You have just thrown the switch to the highest maximum power level. You don't even start at the middle of your rig's capabilities. Just go for the throat of the spectrum.

>

You seem to be justifying your breaking of the R&R, Dave. Several wrongs remain a wrong. You're operating outside the best practice methods the FCC stipulates. What a ham.

I don't think that is extreme, at all, Ed. It just brings up a point. But, Dave has "other heroes" and doesn't live by example of others, doesn't try to postulate on what life teaches us through the actions and thoughts of others. He lives for himself. Heck, he doesn't even follow the book with FCC Regulations. :o

If the techniques and results are the same, why change?

Seems to me like we're in a lose-lose situation. If we stick to the tried-and-proven FM analog voice, we'll lose spectrum because we're not "state of the art", whatever that happens to be. If we go with new spectrum-conserving technologies and free up lots of spectrum, we'll lose it because we don't need it.

That is not too far off the mark, unfortunately. But which of those two
outcomes lets us continue to use the amount of spectrum we actually need?

Amateur Radio has always been seen by the FCC as contributing to the state of
the art. To any extent that this perception is changing, that is unfortunate,
and, in the long run, IMHO, will have unfortunate circumstances.

Doncha think in 1952 there were old "buzzards" frumping and grumping because
it wasn't
done the way "they" did it in 1919? Sort of reminds me of my dear old Dad
at 88.

Rule #1. If it was invented after 1950, it isn't valid.
#2. If a man goes outside, he must wear a fedora hat.
#3 If he leaves the yard, he must wear a tie--even if he is only
going to the store.
#4. Always use 1930s dental floss--wooden toothpicks.
#5. A man must carry a handkerchief; travel packs of Kleenex are a
no-no.
#6. A man must be clean shaven; anyone wearing a beard is to be
suspected of Some-
thing!
#7. The Young'uns are taking us to hell in a handbasket--ever since
1950!!

Isn't that what you see with the "elder statesmen" of ham radio? Things
change--whether we
like it or not, and they have been since time began. So each modern
generation of Amateurs
will always have its curmudgeons being left behind--in fedoras, toothpick
and hankie, grumping
and frumping away because "if it came along since 19??, it ain't valid,
Goldang it!" LMAO!

How about *probably* yes? To assign a persons specific opinion on a subject on what they have said in the past about other subjects is a deduction, and like any deduction subject to significant error. Would she be against Morse Code testing? Very possibly. Was she against driving proficeincy tests before being allowed to have a license? was she against education before practicing a profession?

Rest easy. Schroedinger wasn't really predicting two cats. He would
have said that since no one has observed Carl enjoying CW, there is a
probability that he both enjoys and doesn't enjoy CW - at the same
time. Hence, one ea. Carl, Dick, and Ed.

I think that part of the philosophy is 100% true and valid. The
trouble is, the objectivist philosphy is incomplete.

> For Objectivists, once a principle has been
> discovered by (their version) of reason to be True, the discussion is at an
> end. If you disagree with their principle, then your reasoning is flawed.
> This is the same circular argument found in the Bible -- this book is true
> because this book says that this book is true.

EXACTLY!

The problem is not whether absolute knowledge and final truth exist.
The problem is recognizing them as such when discovered. The cultic
flaw is that once folks with objective-compulsive "philosophy" claim
to have found a Truth, they shut off any possibility of new
information. That's just about a dictionar definition of cultic
behavior.

Let us take a lesson from science.

Isaac Newton & Co. developed a lovely explanation for the physical
world that included such phemonena as gravity, light, time and space.
Newtonian physics derives from a few axioms and pure reason.
Everyhting about it makes perfect sense. And for hundreds of years it
was the unassailed foundation of science and engineering. Many thought
they had discovered the beginnings of Ultimate Truth in physics.

Then, just about 100 years ago, a very strange fellow comes along with
some really wacky ideas. Like "time slows down when you go real fast"
and "energy and matter have an equivalence relation". Worst of all:
"Newton was wrong - his ideas are incomplete".

The true scientists of the day did not condemn the very strange fellow and his ideas, nor did they ostracize him. They tested his ideas and found that reality confirmed them and contradicted Newton. Thanks to the very strange fellow named Albert Einstein, a whole new way of thinking about the universe came to be. Science, engineering and our whole world was transformed by his ideas and the things that derived from them.

Of course many people said his ideas were nutso, but they were not true scientists. They were cultists who claimed to have the Ultimate Truth. Just another form of objective-compulsive thinking. Ayn Rand had it in a BIG way. The whole Nathaniel Branden affair showed that.

> But perhaps Cecil is (again) putting us on.

I have little doubt that he is NOT serious.

> The evidence is in his oft
> asked question "What's wrong with live and let live?".

Also in the fact that he has told us many times that he never posts anything serious here in rrap.

> Central to Ayn Rands
> philosophy is the opposite moral principle (in her words) "Judge, and be
> prepared to be judged."

Yup. Judged all the time, by everybody, for everything. But don't dare judge the judges!

Thanks for a BRILLIANT post, Hans. You made some things very clear.

> driving need to me

Not to me. Rather it shows a definite lack of a broader view of what amateur spectrum managment should be. The repeater coordination mess results from the fact that there's no way to take a frequency assignment back once it's issued. THere are many which are so underused they should shut down and the pair be assigned where it might be used. Instead every one of them is grandfathered.

What is unfortunate is that FCC today has the propensity to listen to advocates of nothing BUT latest technology (a couple of extreme cases show up here in the form of Cecil and Carl), and base their opinions and statements on that alone. A bit of history will soon show that the advante garde of ham radio has always been the few who were basically working in advanced technique fields anyway, as it is today. There are as many or more new communications techniques in use in ham radio today as ever. The push, nay, * shove *, to rid ham radio of "legacy" modes is not

only wrong it is biased against the history of the ARS. Time, need, attraction to new modes and the desires of hams will produce the desired changes in due course. That assumes that ARS isn't overtaken by people with a CB mindset.

I disagree.

I think CAM is serious everytime he scribes something to the newsgroup, and only uses that "Awww shucks, well y'all know I wasn't really serious" gambit as a device to extract himself from the many (il)logical corners that he paints himself into.

Some of us let our Directors know how we thought in the very short
time period between when the BOD meeting agenda was announced and the
meeting itself. I think most ARRL members did not know it was even up
for discussion.
>
> >Want to bet that we'll see some changes in ARRL directors as a direct

Just a plank, not a platform.

How many Directors who voted to change the policy will be up for
reelection before WRC 2003? Afterwards is too late - FCC will drop
code testing before the ink is dry on treaty without S25.5.
>

40 meters has been an issues since before most of today's hams were
even born.
>
> Think about it for a bit -- right now, we have an international treaty
> requiring code testing for HF access in the Amateur Radio Service -- an
> international treaty.

No, we don't, Ed.

We have an international telecommunications treaty. A tiny part of
that treaty regulates ham radio. A tiny part of that part requires a
code test. One paragraph.

> Limiting (or eliminating) ICBMs, global warming,
> overfishing, extradition -- THESE warrant international treaties.

Sure. But the ITU isn't involved with them. Nor is ham radio.

Please explain how code testing is connected to nuclear disarmament or
greenhouse gas emission controls.

> When Morse
> code was THE primary mode in all radio, or at least part of the mainstream, I
> could understand the reasons for an international treaty. But frankly, with all
> of the problems the world faces right now, just about the last thing they need

> testing in Amateur Radio.

Will the ITU reps be debating ICBMs, global warming, overfishing or
extradition? I don't think so.

Your argument is the logical equivalent of the driver pulled over for
speeding who tells a law enforcement officer that the officer should
be spending his time catching violent criminals instead of ticketing
law-abiding citizens for going a little fast.
>
> If the League were to spend any significant part of its spectrum-protection
> resources fighting such a cause, they would lose me as a member.

Which would mean they'd lose your member dollars that support spectrum
protection. And you'd lose your vote for director. Noses spiting faces
comes to mind.

> I have told
> Tom Frenaye that, in so many words.

How did HE vote on the ARRL code test policy change? How did ALL the
directors vote? WHY was the vote kept secret even though it was moved
and seconded to record the vote?

How is the membership supposed to know who to vote for, and who to
comment to, if they don't know how the directors voted?

> But your views may differ, so I encourage
> you do do the same with YOUR Director.

Been there, done that.

Ohhhhh Hans, how can you say such a thing? Manual CW does indeed, include
forward error correction. That's one reason that manual CW is superior to
machine CW which does not include FEC. When you hear on CW, "QTH is
-. . .-- -.- --- .-. -.- " you don't actually believe the
guy is from New Kork, do you?

Dick, Think about it, you haven't applied logic and elementary mathematics to it. 10 year licenses were in effect long before and the growth rate was negative. Now, the growth rate is positive and you attribute that to deaths in the Novice ranks. Novice growth rate is negative but it's ALMOST ENTIRELY attributable to UPGRADES. Are you insinuating that dead Novices are getting upgrades? Have you been subscribing to Cecil logic?

Nobody is pushing to eliminate legacy modes, Dick. You are again
confusing CW, the mode, with Morse code testing, the governmental
requirement.

There are two possibilities:

1) The answer will be yes. No problem

2) The answer will be no, all the pairs are already assigned.

Now I'll ask you one:

If I live in an area where all the 2 meter repeater pairs are already
assigned, why would I want to put up yet another repeater? By a quick
count, I get that there are something like 53 pairs from 146 to 148
MHz alone.

I agree 100%.

But think about WHY the perception is changing. Is it because of code
tests? Nope. We've had no code tests for full VHF/UHF privs for over a

decade, yet we still use basically the same FM technology as 25 years ago. My old HW-2036 hasn't been outdated.

One thing I've learned from ham radio is to fix the right problem.

You can speculate all you want. Claiming to KNOW what JC would have thought about Slick Willy is another matter.

In many METRO areas, sure. But that's only a driving need if you want to put a repeater on the air. Most hams aren't trying to do that.

If the existing repeater pairs are idle 95% of the time, as is alleged, why are more repeaters needed??

>With better spectrum sharing techniques, and there are

Sure - but the problem is that the number of actual simultaneous users is allegedly very small.

THAT'S the problem that needs to be addressed.

That is absolutely incorrect. What we were arguing about is your claim that Ayn Rand would have disapproved of morse testing--that and that only. Since she didn't talk of it or write of it, you can only guess or attend a seance.

The Big Date was April 15, 2000. Two years from that date is a little
less than three months from now. When are we gonna see a product
review on that xtal ball? ;-)

The Speroni figures contradict what you say, Ed.

Consider the period from September 1998 to March 2000. Since AH0A
figures are for the end of the month, March 2000 pretty close to the
end of the 3 code test speeds era.

In the 18 months from September 1998 (672,678) to March 2000
(677,784), the total number of US hams grew by 5,116 - 284 per month.
From March 2000 to December 2001 (683,037) the total grew by 5,253 -
250 per month!

Looks like the change made the growth rate go DOWN.

According to AH0A, the total number peaked in March 2001 (684,359).
Considering the period from March 2000 to March 2001 we get growth of
6,575 - 548 per month. But that growth has not been sustained and the
total has sagged since March.

What numbers are you using, Ed?

So, a group wants to add another repeater, when the existing ones are already idle? Why not approach the owner of an idle system and ask if he minds if the group may run its nets or whatever on it? If he says "yes," no problem. If he says "no," then one has to wonder why he has the system in the first place if it's not being used? This certainly should be less of an issue if the repeater shows up coordinated as "open" instead of "closed" or "private."

I am a repeater owner and also monitor a repeater owned by an acquaintance when he is out of town. The usage on mine has fallen lately due to some of the users (who used it during commuting) losing their jobs. My friend's repeater, even though it is installed at a U.S. Gov't installation as an emergency communications device, is even more idle than mine. In fact, on his, I've only heard perhaps 2 people in the past 6 months (other than him and myself). Granted, his system is on 23cm (1270/1282MHz), but it's there, available, and coordinated as "open." It's my understanding that his 6m repeater (which I do NOT monitor) is even more idle. (Our area has unassigned 6m and 23cm pairs available too, so the issue of an idle repeater "hogging" a pair doesn't come up, let alone the fact that pairs could be shared but aren't yet.)

Is the problem that everyone wants a 2m repeater, and in the absence of that, a 70cm repeater, and gives no consideration to 6m, 33cm, or 23cm? (I skipped 125cm (222MHz) intentionally because in my area, it is fully populated with 3+ systems per pair. I skipped 10m because it only offers 4 pairs.) Is this an equipment problem (since most VHF/UHF radios made are for 2m & 70cm)?

We'll see more Extras now that they're giving the licenses away.

Actually, I question the validity of all "VEC" issued licenses. If you
didn't take the test at an FCC field office, your license is suspect.

>code testing before the ink is dry on treaty without S25.5.

As far as S25.5 is concerned, I think that even if ARRl fought a change tooth and nail (not that I think it should, mind you), the outcome will still be that Morse code will not remain as a matter of international treaty. ARRL's decision was not to expend ARRL resources on the matter. When I consider the issues that ARRL must face on an international level, I think the decision to be reasonable.

Now, speaking as a member, I was somewhat disappointed that the stand was not more firm.

Far more of the "disastor" reports I have seen written up didn't
involve makeshift stations. They were far and away usually
mase stations that already existed, mobiles, and/or hand held.
Even when "makeshift" is called for, being prepared gets the job done
quicker. That may simply mean a predetermined availability of
portable equipment and some prewired antennas, etc. Isn't
that what field day is all about?

Waiting for a disastor before you make sure you have antenna wire, etc
is (IMHO) too late.

Dick,

I agree and that IS what being prepared is about. One can also
be prepared by having the resources ready so that "setting up"
a field station isn't that difficult at all.

Cheers,
Bill K2UNK

IF he wanted to work Europe, he should have been specific in
how he called CQ. Poor operating on his part and more likly just
another abuse of power levels.

Depending on the circumstances, that is exactly correct.
Please don't try to convince us that HF bands on weekdays are at all
busy during normal business hours.

> You must have one of those W3LPL type stations or one of those

watts is
> reasonable power. And of course there are all sorts of variations in
between.

I would suggest that it is almost NEVER the circumstances
whereby 1500 watts is reasonable when first getting on the
air. The exception would only be (IMHO) an emergency.
My comment as to 100 watts being reasonable is focused
at a starting point. If 100 watts doesn't get the results, then
add power. If 100 watts is too much, then reduce. If your
interest is QRP, then start at 1.5 watts.

Cheers,
Bill K2UNK

Business hours there Bill?? When are business hours when it comes to
international contacts? Oh, that's right, the world revolves around
Bill Mr DX Sohl. So if it's 10 am here in the US, that makes it
business hours, so therefore, it must be 10 am and business hours all
around the world? wow, what a concept. YES BILL, the HF bands are very
busy during business hours because somewhere allk around the world it's
either before or after business hours. Before you prove to us that you

haven't any clues as to this topic, check out a few of the telnet
clusters and see that the HF bands are VERY BUSY during your so called
business hours.

Let's go back to the original point, Bill because I think we have strayed from the issue here. The issue *wasn't* being prepared (we all agree on that), it was having to lug a bunch of equipment (more and more as computers, etc get involved) out to the field site. There will *always* be field sites in disasters (they are absolutely necessary) otherwise, who would the EOC talk to? My point was, and *is*, "less is always better" There isn't a "pre-prepared" field site that I know of that has the HF and associated equipment sitting there ready for use. That's the stuff I'm talking about having to lug out there. Again, less is better, and faster to get up and running.

> What numbers are you using, Ed?

Jim, You have to watch the change in the change in these numbers with an eye on what took place 10 years earlier. We all know there was a bump back then because of the introduction of the No-code license. What that means is now there are more license expirations and if the re-up rate is the same you'll be losing more licensees in absolute terms.

We could run the numbers and prove it if necessary.

We can still see them renew to Technician Class from Technician Plus class
so they are not hidden.

The number of Technician Plus that renew is very low... about 6 per month.
The expirations aren't that many, it's almost entirely upgrades.

I worked Silver Spring, MD from Altus AFB, OK on 7 mw. mobile, CW *and* SSB! The driver transistor on my ICOM IC-730 had blown on me, leaving me with just the attenuated mixer output to work with at the time. When I got back home, a friend of mine fixed the rig for me, and measured my total RF output (pre-repair) at seven milliwatts! However, I had made myself heard at that power level on a 15-meter sked I had with a couple of friends of mine in MD (N3CBX and KR8C). Antenna was standard Hustler mobile whip. This was in Nov. '81; I was TDY to Altus at the time.

Hmmm. Memo to the Prop dept: If I'm going to be shooting at hand-
thrown aerial targets, I'd prefer a 12-ga. Beretta O/U shotgun. That way,
I might even occasionally hit one! I'll save the Glock for the saloon
scene. Also, write a scene where I get to use my Winchester Model '94
lever-action rifle (in .357 Magnum) for some Cowboy Action shootin'!

Thank you, Macy, for the specificity. I stand in awe of your superior
'vision'.

Well, I was referring to his arguments about MCW getting through when PSK31
wasn't making it. Then I tell him MCW is illegal in that subband and he just
crawls into a corner with no response because he has no response. Maybe you
could enlighten us since you've taken to his position.

It is still true. When you can read CW through a 50Hz filter, then the playing
field will be level. If a PSK type mode used the bandwidth of a CW signal,
then it could run circles around CW as does PACTOR II. Your experiment is with
apples and oranges and therefore is meaningless.

I agree to a point. There really are two types of "field sites". Those
that need
to be the "less is better" as you suggest...which probably implies short
range,
voice and the more permananent field site which gets set up as a focal point
or "base" that becomes a relay point. In this latter (relay) site, the
preparation
can and should incorporate on the "more is better" approach. Some EOC
operations prepare for this by outfitting mobile communications vehicles.
In such an arrangement, you can accomodate multiple operators, multiband
operations and multiple modes...including CW ops if the local EOC folks
wish to do so.

Also in the latter, redundancy can easily be worked into the planning.

Cheers,
Bill K2UNK

Sorry Jay, your mind is in another place. The fact is that during
traditional business
hours in the USA, you will not (if you are in the USA which is where the
bozo in Ohio was) find the bands busy.

I have never claimed to be an DX wizard, but I can see a poor operator...
and I'll say it again, IF you have no particular intent to contact anyone or
any specific area (e.g. Europe, etc.) then just getting on the air with
a KW is POOR operating practice unttil you have determined
that a more reasonable (100w for example) won't cut it.

> > > > > Perhaps some better "ears"? Maybe

You have only an opinion. You are entitled to it.
My comments were on abuse of power...whatever the
claimed need. Seems that most of the rest of the world
of amateur population gets by fine with lower power
limits.

Cheers,
Bill K2UNK

Irrelevent as long as the overall sylklabus is the same.
No different than being given a list of 200 spelling words
to memorize and then being tested on 20 of them
or 50 of them. The studying still requires the same effort
to pass with the same degree of confidence.

But there is NO reason to test mode skills.
It is not simply knowledge that CW tests at all...it is
a specific skill. No other mode requires that.

The written tests are in the hands of the VCCs and that is
where the changes take place as long as the changes don't
require rules changes. The VCCs could double the question
pools tomorrow with no impact on the rules. I have
suggested that specifically as it relates to formula questions
(i.e. double or triple the possible sets of variables).

> >> >Disagree all you
> >> >want, the FCC doesn't see the parrallel either.

the
> higher level writtens?

You have changed the paradyme of your query.
You now ask for justification based solely on privileges...
which is a more narrowly defined approach. I would counter
that there is significant general knowledge that can and should
be a part of an advanced license that is irrespective of
privileges specifically. That said, until there's
a challenge to writtens, it iremains an academic mind game.
Crusade to your heart's content.

Cheers,
Bill K2UNK

It's obvious (logically) that you used Dick's last name in a blatant attempt to insult him. (bad Rich, bad Rich). We have all been around this NG long enough to use first names even when we disagree. (don't you agree?) (agree) (disagree) (strongly agree) (strongly disagree) please check one.

Logic has nothing to do with understanding where MCW can or cannot be used within the ARS. It's a simple matter of interpreting the rules.

And thanks for recognizing my superior "vision". Even *I* amaze myself sometimes. Your awe has been duly noted and a follow-up letter will be sent as a reminder for future reference. : -))

Look - Why would any novice NOT upgrade if he was still breathing and still involved with ham radio beyond holding a license for a hobby for which he no longer held an interest? My point was that novice upgrades would be much higher if it was not for the fact that so many novices (as well as techs) have simplyu lost their interest. Some might regain enough to want to go ahead and upgrade, but they have lost all contact with current happenings in ham radio and are not even aware there was such a thing as restructuring. I know some people in that situation.

>Are you insinuating that dead Novices are getting

> upgrades

No. I guess I need to spell it out for you. With ten year license terms there will be many silent keys who will be shown active in the database for long periods after their demise. Five years longer than when we had five year licenses.

Turns out those slimey folks didn't need to be degreased, after all.They
just needed tests they could pass.

Umm, that is a case where my lack of response saves you from embarrasment yet
again. The CWID on PSK31 is *not* MCW.

Sure it does. And your ill advised conclusion shows your lack of understanding of real world communications issues. If one watt PSK31 can't be copied but it's 1 watt CW signal can, that is what is of interest to communicators. We're perfectly willing to leave the theoretical comparison of efficiencies to those of you who really believe the mode that won't work is superior to the one that does under that set of circumstances. You clearly cannot understand or appreciate the difference.

>If I recall, the Tech pluses can only decrease now because those
>that are simply being renewed are then only identified as Techs.

They changed that, Bill...remember?...A person with a "Plus" prior to April 15 00 can be ID'd in the database. Simply look at the category "Previous Class"

However a person holding a "Tech" but exercising "Plus" by virtue of a 5WPM CSCE cannot. A lot of those "Techs" on Jim's accounting could really be "Pluses" by virtue of a CSCE. That number is indeterminate.

Then call the man, Bill. You are one of the whiniest people I've seen
here BUT, be sure to be the best operator and NEVER EVER make mistakes
Bill. Remember to ID every 10 minutes cause sometimes you forget and
that's poor operating

>That's an odd answer, Bill. If you don't have those answers, how will you
>defend the theory tests?

Perhaps by stating that electronics theory is more relevant to modern radio
technology than is Morse code.

Had Amateur Radio started out by being not relevant to modern radio technology,
it never would have gotten off the ground.

I will pass this suggestion on to the QST Product Review editor. It could be as simple as noting in the test results whether the dynamic range testing was done with AGC on or off. Our convention is to turn it off for those tests.

Per Bill Sohl

If I can't hear anything, the bands must be dead.

If you are calling CQ and want to talk to Europe, be sure to specifically state that or else people like me will come back to you and then whine about the power you have but I don't

It's poor operating procedures if at first you don't try for a contact using only the electrical waves of your brain and then increase the output to 100 watts (the maximum power I have)

10am in the US is the within the traditional business hours of the world, therefore no one will be on HF because I can't hear anything.

Be sure to whine about everything DX on a newsgroup thereby showing just a very very VERY small segment of the amateur world that I am indeed clueless how propagation works, especially on HF since I, Bill Sohl, am a VHF FM type of guy.

Be sure to apply US rules and regulations to everyone around the world because after all, the US IS the center of the amateur universe (according to Carl Stevenson, another major DXer)

and finally,

make sure that all the world knows that Bill Sohl is bsolutely perfect in a Mary Poppins type of way when it comes to his operating policies..he starts at 5 watts and then increases his power until the guy next door can hear him

and remember, when you get that vaunted K2UNK card in the mail, without SASE/Greenstamp/IRC, etc, return via the buro with the NIL all over it because you..the DX don;t need another know it not type telling you how to operate in good Pollyanna form

73 es DX IS (for those that can hear any since there is rarely any in the morning here in the good ol USA)

just a few spots (starting at 10 am somewhere in the world. Not all of them..about 15% Note the preponderance of US spots (actually this is a foreign telnet cluster)

You have created an interesting new theory, Bill: If he's loud, he's a
poor op and a power abuser. Sounds like a case for NPI (No power
International).

I'd suggest that you are talking through your hat. My interest is QRO.
Now what? Get back to us when the FCC mandates a starting power and
frequent circuit quality checks and power adjustments during a QSO or
series of QSOs. Are you running out of anti-morse testing rants?

Yes they might and they are free to do so. I disagree as to the
importance of CW in emergencies to begin with. IF an EOC wants
to integrate morse into their preperations, they are free to do
so. I haven't opposed that...rather the track record of actual
readiness preparations seem to have already defaulted from
using morse for a number of reasons...e.g. ONLY the ham
can listen, copy and read morse while other modes allow
the ham to be the control op and non-hams to "fill-in" at
the mike or keyboard.

Cheers,
Bill K2UNK

I'm not interested in getting by. If it is instances of abuse of power you'd like to investigate, start with the Clinton administration.

>Are you worried I (we) won't be prepared to do so.

Your responses tell me that you don't have the answers.

Simple challenge: Come up with reasons to defend the need for theory tests
beyond what's in the
Tech, and I'll come up with FCC-type replies showing why that stuff should not
be tested. Note that
I'm only talking about theory - regs and safety are a different matter.

> >You have so little faith in the FCC.
>>
>> Why should I have faith in the FCC?
>
>OK, don't have faith then.

This is the FCC that gave us "incentive licensing", which NCI Executive
Director WA6VSE and others have called
"a dismal failure". This is the FCC that continues to prohibit things like many
designs of external RF power amplifiers - not because
of what hams do, but because of what bootleggers and cbers do. This is the FCC
that couldn't even write a coherent
NPRM or errata to it!

This is the same FCC that approved the new Extra Q&A pool, then had to remove
three questions from the

APPROVED pool because of blatantly obvious errors.

WHY should I "have faith" in the FCC?
>>
>> You missed the point, Bill. FCC simply disagreed with all the procodetest
>> arguments.
>
>But they gave their explanation as to WHY they disagreed.
>The FCC didn't just say...sorry we don't agree.

And they will tell you WHY they disagree with the theory tests, too.

I can do their style. See challenge above.

I disagree. There are plenty of situations where 1500 watts is the reasonable
level. It all depends on the conditions, station setup and what the hams
involved are trying to do. I say leave it to the operators to decide.

>My comment as to 100 watts being reasonable is focused
>at a starting point. If 100 watts doesn't get the results, then

>interest is QRP, then start at 1.5 watts.

Why not start at the bottom and work up? The difference between 1500 W and 100
W is LESS than the difference between 100 W and 5 W.

Would you like it if the feds brought back the 55 mph speed limit and strictly
enforced it? 55 is a reasonable speed. How about if they enacted new horsepower
limitations on cars, specifying no more than a certain number of HP per 100
pounds of car? 40 pounds per HP is a reasonable number.

Same difference.

BINGO!

That's EXACTLY the problem!

One the one hand, I am told "there are no pairs available". On the other, I am told they sit idle 95% of the time!

Huh?
>
>I am a repeater owner and also monitor a repeater owned by an acquaintance

>systems per pair. I skipped 10m because it only offers 4 pairs.) Is this an
>equipment problem (since most VHF/UHF radios made are for 2m & 70cm)?
>
Maybe. Here's another idea:

I remember when there were only a few repeaters around here. They acted as
"watering holes" - everybody went there. And they were usually busy because of
the attention they received. If you wanted a QSO, you either announced your
presence on a quiet machine or joined an ongoing one. If you wanted to find a
particular person, you only needed to look a few places to find him/her. One of
the attractions of the repeater was the large numbner and wide range of folks
that hung out on each one.

The proliferation of repeaters diluted all this. End result is less usage from
the same number of users. And the resources to support a repeater are similarly
diluted.

The FCC has changed dramatically over time. The FCC is
people doing their jobs. People change, attitudes, change,
etc. Frankly, Jim, at this point, I am not at all worried about
the FCC doing away with theory tests because I just don't
believe it will happen.

> This is the same FCC that approved the new Extra Q&A pool, then had to
remove

> because of the introduction of the No-code license.

The change to 10 year licenses took place in 1984. Grace period went
to 2 years.

By 1989, all US hams had 10 year licenses.]

From 1989 to 1994, there were no expirations of US amateur licenses.

After 1994 (years before restructuring) the 10 year licenses began to
expire.

Somewhere in the mid-90s the vanity callsign rules changed.

Vanity callsign request gives you a renewal even if you are not within
90 days of license expiration.

> What that means is now
> there are more license expirations and if the re-up rate is the same you'll
> be losing more licensees in absolute terms.

That effect began 8 years ago.
>
> We could run the numbers and prove it if necessary.

I'd like to see them.

Hey Bill, what makes you ASSume that your nifty W8 contact had not started out at 100 watts and increased the power because at 10am on a business day in the US because the HF bands are not that busy, he hadn't anyone of DX consequence come back to him?

Are we to ASSume that you were there when he first started his cq cq??

Just curious as I fail to see how you are in a position to pass judgement on anyone other than yourself (he who is without sin..casting of stones..glass houses and all that other religious zeal stuff)

My comments were and still are directed at REASONABLE.
Most barefoot transcievers are in the 100 watt range.
If starting at 5 w is something someone wants to do, that
is certainly OK with me. Starting with 1500 w isn't. I just
can not fathom anyone turning on their rig, listening for a bit
and then starting out immediately with 1500 watts except,
as noted above, under very few (emergent) exceptions.
That's MY opinion.

> Would you like it if the feds brought back the 55 mph speed limit and
strictly
> enforced it? 55 is a reasonable speed. How about if they enacted new
horsepower
> limitations on cars, specifying no more than a certain number of HP per
100
> pounds of car? 40 pounds per HP is a reasonable number.

The analogy is totally false. High speed does not cause problems to other
vehicles...assuming one is not driving above road conditions. Under
certain traffic conditions, driving 55 on a posted 65 mph road can
be dangerous and a cause for a summons for reckless driving.

Cheers,
Bill K2UNK

Even according you that possiblity, he NEVER lowered his power
at all during the QSO...even after getting my comments as to him
being recieved as he was. Poor operating practice in my book...you are
free to consider otherwise.

If we all subscribed to that theory here, we'd have no discussion, dialog,
debate. I have every right to pass judgement as I see fit. You
are free to do so too...as you have making your own judgements
of me every time you reply. You are free to do so, as I am.

Cheers,

I can only reply in like kind. If you start something that PROVES a total lack of credible discussion, be prepared for similar responses.

And I did not do any exagerration of your comments. Your comments, by proof of their total lack of understanding of HF and propagation were exagerrated enough

The only thin going for you right now is the fact you haven't started trotting out a story for all occasions a la Cecil.

Maybe a story about when you were dx'ing in your antique toy car, trailing a 160 full wave wire suspended from several weather balloons, running less than 100 watts and you got hit by lightening and were teleported back to the late 1880's where you tried to prevent Sammie M from developing Morse code by pretending to be Alfred V and inventing the microphone and hitting Sammie on the head with a bottle of champagne, inserting 3 dimes and you see..he we are..Wait a minute. Am I seeing double. there are 2 of everyone but me

sorry a Nick Danger flashback

What an arrogant SOB you are. He didn't even consider turning down the
power?? Have you a clue as to how most amps work? I think not. So he
turns down the power, now most likely he has to retune his plate
current, so instead of satisfying you MR BILL SOHL, keeper of all that
is proper, he has to throw a carrier on the air, assuming since he is a
rotten operator that he does not have a dummy load and instead of
hearing you critique him he is sending tones through the uncrowdedd HF
on normal business days at 10am everywhere on earth?

HUH.

yes, you are so far out of it, you are in orbit

Thanks Bill. Keep on proving to the world that it best some people actually not try to prove they are clueless in some areas

BTW are you aware that the ARRL fires up all its amps when they are broadcasting they're daily bulletins? I suggest you complain to Ed as this is a prime example of your guilt by Bill's rules of poor operating

> change--whether we
> like it or not, and they have been since time began.

SOME things change. Some change must be accepted, but other change
must be
resisted.

Two words: New Coke.

> So each modern
> generation of Amateurs
> will always have its curmudgeons being left behind--in fedoras, toothpick
> and hankie, grumping
> and frumping away because "if it came along since 19??, it ain't valid,
> Goldang it!" LMAO!

Some new stuff ISN'T valid. And the real message is that we forget
history at our peril.

Back in '96 the "Little LEO" satellites were a real threat to our
bands, including 2 meters. Should we have simply accepted that "change
happens"
and not fought the loss of spectrum? Note that the Little LEOs turned
out
to be a colossal flop, too.

A few years ago many pundits were saying that the old business cycle
rules
no longer applied to the new era of ebusiness. "Change happens", they
said.
Then came boom-dot-bust and you can buy fancy Aeon (sp?) chairs for a
song.

"Bill Sohl" <billsohl@mindspring.com> wrote

> True, but we can't specifically identify those that did so.

Why not??? The databases are very well known. You can mine any information
you desire out of them. I'm not only talking about the FCC's running
(current) one. There are CD-ROM snapshots all along the way. You can write
programs to find out anything you want to know about the flow of individuals
or the total flow of changes in license statuses of any group you define.

> > The number of Technician Plus that renew is very low... about 6 per
month.

> In reality, there shouldn't be any.

Why not? Are they supposed to be thrown out of the ARS when the 'sell by
date' arrives. ;-)

> > The expirations aren't that many, it's almost entirely upgrades.

> I'm not certain that is so.

I posted on this subject December 5th 2001...
(Note: this was as of November 2001 numbers)
---

1) Technician Plus licensees decreased by 41,660. (your previous post)

2) 5,691 Technician Plus license expirations

3) 180 Technician Plus license cancelations

4) 73 Technician Plus license renewals (on time)

5) 7 Technician Plus license renewals (during grace period)

So... let's see...

We lost 41,660 but...
5,691 were expirations, so subtract them...
we know where they went...
that leaves 35,969 unaccounted for...

180 were cancelations, so subtract them...
we know where they went...
that leaves 35,789 unaccounted for...

80 (73 + 7) wer renewals, so add them...
we know where they came from...
that means 35,869 are unaccounted for...
hmmmm.... could they be upgrades???? :^

So, Bill, considering that 86% of the Technician Plus, who don't have Technician Plus privileges anymore, have upgraded... I would characterize the decline of Technician Plus numbers as a good thing... almost entirely upgrades.

Rich

Don't 'spell it out'... it's your math we're talking about, not your
spelling. Actually it's only 2.5 years longer. With a 5 year license term
the average SK would be dead for 2.5 years before the license expired. With
a 10 year license term the average is 5 years. The difference is 2.5 years
(5 -2.5 + 2.5). ;-)

at least 1 per minute being posted, excluding the 6 meter spots.
Including them and the average is better than 3 per minute. This
particluar cluster nly posts about 60% of all the internet spots, so
there are considerably more out there. And this is just what is being
posted, so there are even more people out there on a traditional
business day in the US at 10am BST (bill sohl time)

Guess Bill needs a better pair of ears (read antennae) cause I hear
almost 90%of all these posts plus a lot more

Just remember..it's 10am somewhere in the world. That leaves 23 other
hours to be elsewhere. The fact Mr. Bill OOOOHHHH NOOOOO categorically
states that when it's 10am business time in the US that the rest of the
world is also experiencing business hours shows a total lack of
understanding in things DX

Where in the world did you get the *incorrect* idea that anyone disagrees with being prepared?? Not from me. Oh, you believe that anyone who holds the view that CW is a viable emergency communications mode is automatically unprepared. Just as I thought. You simply don't know any better.

So what happens when you don't get to decide about the preparations? Is everyone -every licensed ham- expected to maintain the exact same level of preparation at all times?? What if, due to circumstances completely beyond your control, you are thrust into a situation where you are forced to use gear other
than your own, and you must make do with what is there?? What it it is capable of only SSB and CW operation, and atmospheric conditions are so poor that SSB won't get the job done? I guess you're just out of luck. I'll fire up on CW and fervently hope that you aren't on the other end of the circuit.

No problems to other vehicles until they run into one or another! Then
the difference between 55 and 80 is significant to say the least!

Actually seems a pretty good analogy to me.

Nor do I. The two are pretty close, though. Often I can near more amateur CW
stations than SSB stations on the HF/MF ham bands.

FM activity is nowhere near the level of SSB or CW on the HF/MF ham bands.

But you wrote:

"I don't know whether FM or SSB voice is #1, but CW is behind both, IMHO."

even though I had specified the amateur HF/MF bands.

AMATEUR RADIO NEWSLINE(tm) REPORT #1275 - January 18 2002

Amateur Radio Newsline report number 1275 with a release date of
Friday, January 18th 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. A new ham antenna on the I-S-S and a new microwave record down-under are first on Amateur Radio Newsline report number 1275 coming your way right now!

(Billboard Cart Here)

**

HAM RADIO IN SPACE: NEW ANTENNAS INSTALLED ON THE ISS

An American astronaut and a Russian cosmonaut ventured into space on Monday January 14th to move a construction crane and install a new set of ham radio antennas on the International Space Station. Roy Neal, K6DUE, has the details.

--

THERE IT WAS, ON NASA TELEVISION, TWO WHITE SPACE SUITED CHARACTERS, DWARFED BY THE IMMENSITY OF THE INTERNATIONAL SPACE STATION. FOR THE 32ND TIME ASTRONAUTS AND COSMONAUTS WERE OUTSIDE THE HUGE SPACECRAFT TO ASSEMBLE HARDWARE.

THEIR PRIMARY OBJECTIVE WAS TO MOVE A BIG CARGO CRANE FROM ITS TEMPORARY BERTH ON THE UNITED STATES SIDE OF THE ORBITING OUTPOST TO A PERMANENT LOCATION OUTSIDE THE DOCKING COMPARTMENT OF THE RUSSIAN CONTROL MODULE.

THAT ACCOMPLISHED, THEY WENT ON TO UNFURL A HAM RADIO ANTENNA. ASTRONAUT CARL WALTZ, KC5TIE AND COSMONAUT YURI ONUFRIENKO, RK3DUO, DEPLOYED THE RIBBON OF TAPE THAT SOON WILL BE IN USE ON A HAM RADIO STATION IN THE SERVICE MODULE,. WHERE THE CREWS LIVE AND SLEEP. A SECOND STATION HAS BEEN IN SERVICE FOR SOME TIME INSIDE THE SO CALLED FUNCTIONAL CARGO BLOCK, ANOTHER SECTION OF THE I S S.

FRANK BAUER, KA3HDO, THE CHAIRMAN OF ARISS, THE GROUP THAT IS RESPONSIBLE FOR AMATEUR RADIO ON THE SPACE STATION, CONGRATULATED THE INTERNATIONAL TEAM OF LICENSED HAMS FOR THE SUCCESSFUL CONCLUSION TO MONTHS OF HARD WORK.

ON JANUARY 25th ONUFRIENKO IS SCHEDULED TO GO OUTSIDE AGAIN, WITH FLIGHT ENGINEER DAN BURSCH, KD5PNU, TO INSTALL 3 MORE HAM RADIO ANTENNAS OUTSIDE THE MODULE THEY CALL ZVEZDA, THE CREW COMPARTMENT THAT'S THE SIZE OF A PASSENGER BUS HERE ON EARTH.

HAM RADIO IS GROWING RAPIDLY IN SPACE, ALONG WITH THE INTERNATIONAL STATION ON WHICH IT'S INSTALLED.

FOR THE AMATEUR RADIO NEWSLINE, ROY NEAL, K6DUE

--

The Expedition 4 crew will remain on board the ISS until May. And according to Frank Bauer, KA3HDO, another important task is to bring the automatic packet system back on line. He says that ground technicians are working with the astronauts and cosmonaut on that project and that task will continue as crew time permits. (ARNewsline from information provided by ARISS, NASA.)

**

HAM RADIO RECORDS: 24 GHZ DOWN-UNDER

A new distance record is set on a band where even commercial interests are only now starting to tread. And its a group of Australian hams who have set it. Q-News Graham Kemp, VK4BB, has the details:

--

A new Queensland distance record on 24.048.1 GHz USB was established morning of Tuesday 08 January over a 72.8 Km path. Location 1 was at Wellington Point, with VK3ZQB and VK4ZHL portable. Location 2 was at Caloundra, with VK3XPD and VK5DK portable operating.

Signals strengths up to 5x5 after initial optimization with typical daytime QSB. The visiting team are continuing with local propagation experiments. The challenges of building and operating microwave amateur radio equipment are wonderfully rewarding in many ways!

From Q-News Australia, I’m Graham Kemp, VK4BB, for the Amateur Radio Newsline.

--

Further experimentation is expected to bring even more record setting contacts in this very microwave ham radio band. (Q-News)

**

RESTRUCTURING: BIG LICENSING SUCCESS IN THE UK

A new slow-code license recently introduced in the United Kingdom is also setting records. This in the area of people flocking to get it. Jeramy Boot, G4NJH, days that the new British Foundation License is on its way to becoming a major success:

--

The Radio Licensing Center reports that, as of the 7th of January, exactly 600 of the new M3 Foundation Licenses had been issued.

In the 'QSO Party' for Foundation Licensees that took place on the 1st of January it is estimated that about 100 M3 stations were active. Many joined the one-minute-past-midnight 80-meter net and many more were heard working DX during the subsequent days.

One person active on the 1st of January was Mike Marsden, M3BQH, who also holds the callsign G8BQH. Mike reports that he worked Alex, UR5EDU, in the Ukraine at

two seconds past midnight, using 10 watts on 40 meters. The report was 59+10dB. After a few hours' sleep M3BQH worked 66 stations on the first day, with only two short CQ calls.

"The pile-up queue was never ending, I even managed to work seven other M3s", Mike said.

Jeramy Boot, G4NJH

--

To put this in perspective. The UK has 57,814 hams so 600 is about 1%. Here in the United States we have close to 625,000 licensees. That’s the equivalent of getting 6250 hams signing up for a new license class here in the USA in only a few short days. (GB2RS)

RADIO REGULATIONS: FCC'S APPROVES DRAFT WRC PROPOSALS

The FCC’s Advisory Committee for the year 2003 World Radiocommunications Conference has approved its preliminary draft proposals. The document has been assigned as D-A-02-101 and deals mainly with satellite and terrestrial allocations in the UHF and microwave bands. Amateur Radio is only briefly mentioned in the area of 890 to 1350 MHz allocations.

The Advisory Committee itself was formed in January of 2001 to assist in the development of United States proposals for WRC 2003. DA-02-101 is based primarily on the committee report. Comments on it are due on it no later than January 28th.

The complete of 55 page text of DA-02-101 is on the FCC website at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-02-101A1.txt (FCC)

**

ENFORCEMENT: CLEAN UP THE INTERFERENCE - PLEASE

The FCC has written to an A-M radio station and an electric power provider to help resolve an unusual and long-standing interference situation. One affecting local amateurs in the Cincinnati and Mason Ohio areas. Amateur Radio Newsline’s Don Wilbanks, KC5MFA, brings us up to date:

--

The letter suggests that multiple sources may be involved in this interference case. Also that two that are possibilities are Cinergy Corporation and radio station WLW. Cinergy is the electric company to the affected area and WLW is a Clear Channel Communications owned power-house AM station serving the greater Cincinnati area from a transmitter in Mason.

WLW operates on 700 kHz with 50,000 Watts into a single element diamond shaped half-wave vertical tower. This is only one of two such towers left in the United States, the other belonging to WSM AM in Nashville Tennessee. Both were constructed in the early 1930's by the now defunct Blaw Knox Construction Corporation.

One of the amateurs affected is Bob Reiff, WA8ULW, of Mason. Reiff told the ARRL Letter that while the noise is most noticeable on 160 meters, it's showing up elsewhere. He says that some local hams suspect it is even causing problems even on a two meter repeater.

In its letters, the Commission says that it recognizes this to be an unusual case. It says that the source of the interference could turn out to be something else unexpected. But the Commission adds that it is turning to the radio station and electric utility company and asking for their help in finding the source of the noise plaguing the Mason ham community. It's also asking that both cooperate with the technical experts from the American Radio Relay League in solving the problem.

For the Amateur Radio Newsline, I'm Don Wilbanks, KC5MFA.

--

By the way, More information on this very interesting Blaw Knox diamond tower design and the ones installed at both WLW and WSM is available on-line. Simply take your browser to http://www.wsmonline.com/w_homepage/tower/index.html. Its very interesting reading. (FCC, ARRL, Amateur News Weekly)

**

ENFORCEMENT: UNLICENSED OPERATOR TOLD TO EXPLAIN

A former ham that the FCC says may have been on the air without a license has been asked by the agency to provide an explanation. The person posing the questions is FCC chief ham radio rules enforcer Riley Hollingsworth, K4ZDH. And in a recent Rain Enforcement log, Hollingsworth outlined the situation:

--
Hollingsworth: "We requested clarifying information from Brian Bailey, ex-KD5PXQ. His license was set aside by the Wireless Bureau on October 19th. We want to know his exact whereabouts on two specific days in September. Bailey has been in touch with us and is deciding weather to provide the information."
--

According to Hollingsworth, the information that the FCC wants from Bailey relates to allegations of unlicensed operations and malicious interference. (FCC, RAIN)

**

HELPING HAMS: HAMDIHAMS NEW E-MAIL ADDRESS

This note: The Courage HandiHam System has a new electronic mail address. You can now reach the group at handiham@courage.org. You may also contact its Director Pat Tice directly at wa0tda@arrl.net. (HandiHams)

**

CONVENTIONS: HAMVENTION SAYS BRING YOUR BUS AND LAVE THE PARKING SPOT TO US

Free parking at the HARA Arena for Hamvention? Well, kind of. Its free if you leave your car at home and charter a bus to bring in a pretty large group of people to the event. Amateur News Weekly's Phil Thomas, W8RMJ has the not so complex details:

--

For Amateurs who charter a bust to make the annual journey to Hamvention, the Dayton Hamvention Committee will reserve a parking place for your chartered bus for the entire three days of Hamvention. The reserved parking will be close to the HARA Arena Complex, allowing not only a place to secure your valued purchases, but also a place to rest those weary feet after walking many, many miles of Hamvention. Space is limited for the new charter bus parking area. Pre registration is required. Availability is on a first come, first served basis.

--

For more information on the new on-site charter bus parking offer or to reserve a space, please contact the Dayton Hamvention office. It's open normal business hours Eastern Standard Time at are code (937) 276-6930. You can also fax your request toll free at
1-800-491-4267. (Amateur News Weekly)

**

CONFERENCES: SE VHF SOCIETY IN APRIL

Greg Robinson KB4NVD says over the VHF Reflector that the Sixth Annual Southeastern VHF Society Conference will take place April 26th through the 27 Th. in Oak Ridge, Tennessee. The conference, hosted by the Southeastern VHF Society, promises to be an interesting and exciting event with presentations from accomplished VHF and up amateur radio enthusiasts from several parts of the country. Registration, program details, hotel and travel information can be found in cyberspace at www.svhfs.org. (SE VHF Society)

**

HAM RADIO EVENTS: KIDS DAY A BIG MID-WEST SUCCESS

The first Kids Day operating event for 2002 was a rousing success in many venues. But in one Mid-West city a bit of coverage on a local T-V station helped to make it even better. Again to Amateur News Weekly and reporter Jack Parker, W8ISH:

--

Kids Day at the Indianapolis Chapter of the American Red Cross got a boost when event coordinator Stece Wendt, KB9RDS, made an appearance on a local TV news program. During the two minute segment. Wendt told viewers that all kids and their parents were welcome to share in the Amateur Radio experience, including an introduction to Morse Code, VHF repeaters and HF:

--
Wendt: “And then we turn around tand take them over to the big radios -- the big base station radios where they can talk -- literally -- around the world.”
--

This is the second year the local Red Cross chapter has shown young people how to tune in the world.

Reporting from Indianapolis Indians for Amateur News Weekly, This is Jack Parker, W8ISH.

--

This is just one of many Kids Day success stories. We will have more in future Amateur Radio Newsline reports. (Amateur News Weekly)

ARNEWSLINE(tm) FINANCIAL UPDATE WITH N6TCQ

It’s time for a report on the financial situation here at Amateur Radio Newsline. With it is our Support Fund Administrator and Corporate Treasurer, Andy Jarema, N6TCQ:

--

It is January of 2002. A brand new year for ham radio. And the beginning of another year for us here at the Amateur Radio Newsline. And as we start off the new year, here are the current finances.

Looking in the new corporate checkbook, the balance shows us at about $700 give or take a few bucks. Not very much when you consider that it takes over a thousand dollars a month to produce these weekly 20 minute Q-S-T’s.

Obviously, Amateur Radio Newsline is going to need your help -- and -- need it quickly to keep it from going away and to keep the news of ham radio coming your way.

We have done all that is possible from our side to keep costs under control. But, some fixed expenses like the telephone and long distance calling are a must have. So are electronic mail and world wide web access. There is the cost of the routine maintenance on the tape machines and editing gear. And in a few months the Newsline sponsored Young Ham of the Year Award will be rolling our way. All of this adds up and some costs just keep going up. When you add it all up and average it out, it comes to that $1000 a month figure I just mentioned.

So now is the time when Amateur Radio Newsline has to ask to ask that you help to keep its newscasts coming your way. Your tax deductible contributions can be sent to the Newsline Support Fund, Post Office Box 660937, Arcadia California. The Zipcode is 91066.

Ill be back within the next few weeks with an update on how things are going. For now from the Amateur Radio Newsline support center, I'm Andy Jarema, N6-Tiny-California-Quake.

--

Don't worry if you missed the address. It will be repeated in a few minutes at the end of this weeks newscast. (ARNewsline(tm) Support Fund)

**

ARNEWSLINE(tm): WE ARE GOING MP3

One other piece of news concerning Amateur Radio Newsline. As of March 1st, we will be dropping Real Audio and going exclusively MP3. Why the change? Well ever since we began posting a downloadable MP3 file at our own FTP site along side the Real Audio file, 9 out of 10 people have chosen the MP3. And with good reason. MP3 simply sounds a lot better than Real Audio to most of you. And by dropping the Real Audio, we can make the MP3 sound even better by encoding at a higher bit rate.

Right now, you can still compare the two formats if you like. Until February 22nd we will continue to post both Real Audio and MP3. Take the time to download both. And don't worry. Most modern media players including Real Audio, Microsoft Media and Winamp play MP3 so the chances are that you are already equipped to cover of the digital format change. (ARNewsline(tm))

SCIENCE AND TECHNOLOGY: THE NOISE OF EARTH

According to Space Daily, researchers have known for three decades that the Earth is a potent radio transmitter, but they were never able to pinpoint where the noise was coming from. Recently, by using data from the four spacecraft of the European Space Agency's Cluster mission, NASA-funded scientists have precisely located the source of the radio noise along the magnetic field lines. The noise originates several thousand miles above bright regions in the Earth's
northern lights. (AMSAT, Space Daily)

**

INTERNATIONAL-CANADA: ARE AGREEMENT IN B.C.

Turning to international news, Radio Amateurs of Canada which sponsors that nation’s Amateur Radio Emergency Service has signed a Letter Of Understanding and the British Columbia Provincial Emergency Radio Communication Service. The letter represents the collaboration between Radio Amateurs of Canada’s British Columbia Section Manager Fred Orsetti VE7IO and Supervisor of Information and Communications Technology for the Provincial Emergency Program Andrew Bryan VE7KSN, to provide a cooperative plan to carry out emergency communication. The letter also further enhances the work of the Canadian ARES program and compliments the Memorandum of Understanding signed May of 1994 between Radio Amateurs of Canada and Red Cross. (RAC)

**

INTERNATIONAL - CANADA: VE1AWA RESIGNS AS MARITIME PROVENCES SM

Due to personal reason Roy MacIntosh, VE1AWA has stepped down from the position of Section Manager for the Maritimes. Tom Caithness, VE1GTC has been appointed acting Section Manager pending outcome of the upcoming election call. (RAC)

**

INTERNATIONAL - UK: AMSAT-UK COLLOQUIUM

The 17th AMSAT-UK Colloquium will be held at Surrey University in Guildford from the 26th to 28th of July this year. AMSAT-UK is now inviting speakers to submit papers about amateur radio space and associated activities for this event and for the Proceedings document. Offers of papers should be submitted as soon as possible and should be sent only to Richard Limebear, G3RWL. His e-mail goes to g3rwl@amsat.org. (AMSAT-UK)

**

HAM RADIO IN SPACE: WEBSITE UPDATE

AMSAT reports that IK8XLD has updated his website with information about satellite operations, EME, the ham radio operation on the International Space Station, ATV and homebrew equipment. You can visit Rocco’s website at www.qsl.net/ik8xld. (ANS)

**

DX

In DX, DJ4KW and DK9GG are active from Belize as V31YN and V31GW respectively until about the 2nd of February. Activity is on CW, RTTY and PSK 31. (GB2RS)

And KE1F will be active on 10 to 160 meters CW, SSB and perhaps RTTY as ZF2LM from Grand Cayman Island from the 14th to 30th of January. (GB2RS)

Also R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28 MHz with 100 watts to an R6000 vertical. For all three, QSL as directed on the air. (OPDX)

Last but by no means least, word that JX7DFA, is on a job assignment to Jan Mayen. He is operating as LA7DFA. QSL via his home call. He will reply when he returns home in the Spring. (Modern DX)

**

THAT FINAL ITEM: A CALL FOR ARDF HUNTERS FOR THE WORLD GAMES

And finally this week, 2002 may be the biggest year yet for fans of hidden transmitter hunts, especially the ones that are all on foot. Amateur Radio Newsline’s Joe Moell K0OV helps coordinate happenings like these and has news of two major events.
--

Every two years, hams from around the world gather to see who is best at on-foot hidden transmitter hunting, also called foxtailing, radio-orienteering and ARDF. There are separate events on eighty meters and two meters, each with five transmitters scattered in a forest that can encompass 1000 acres or more.

Competitors are divided into five categories for males and four categories for females. Each country may have up to three persons per category on its team.

Back in Y2K, the championships were in China, with a dozen stateside hams among the competitors from 26 countries. This year, the excitement moves to Slovakia and takes place from September 2 through 7. Once again, ARDF Team USA will be there.

Would you like to be on that team? If so, contact me right away, because USA must submit its Letter of Intent to the Slovakian hosts by the end of January.

Of course you'll need lots of practice beforehand, and you can get plenty by attending USA's own national ARDF championships, which will be April 19-21 in Pine Mountain, Georgia, near Atlanta.

Find out about both championships -- Slovakia and Pine Mountain -- by visiting my Web site: www.homingin.com. Homingin is one word. Then apply for the Team USA roster at my e-mail address on that site, or by postal mail to my callbook address.

Maybe you'll bring home a medal this year. From southern California, where this year's local radio-orienteering training sessions will begin soon, this is Joe Moell K-zero-Oscar-Victor for Amateur Radio Newsline.

--

In case you missed it, Joe’s website is www.homingin.com. “homeingin” is one word. (K0OV, ARNewsline(tm))

They have a pretty cool plan now, where you can get a life time membership
and pay for it in 8 quarterly installments of 122 each. I have a few bills
that will be paid off this spring, then I plan to sign up for it. Will save
me money in the long run, and I won't have to remember to renew each year.
(I had forgotten last year, and wound up calling on my cell phone while
driving back from holiday vacation on Dec. 28th.)

2105. ARRL - Right and Wrong

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-18 19:10:29 UTC
From: N4IXT <n4ixt@arrl.net>
Message-ID: <a29s62$vr088$1@ID-105647.news.dfncis.de>
Source record: 31692

This stems out of the "Is the ARRL still screwed up?" thread. Everyone seems to have passionate opinions about the ARRL, pro and con.

So, out of curiosity, name one thing you think the ARRL does right, AND one thing they do wrong. I'll kick one off...

Right - Fighting for spectrum. I must say they do a good job of keeping in there, fighting to protect our current spectrum, and get more. Most recently the fight over low power devices in the 440 band, and the quest for a 60 meter band come to mind.

Wrong - Advertising. The ARRL does a horrible job of letting the community know Hams exist. After 9/11 calmed down, the ARRL top brass should have been on every news outlet and talking head show, touting the benefits of Ham radio and the part hams played during the crisis. Same goes for a large scale occurrences such as hurricanes, etc.

It'd also be nice to have more materials available to hand out to folks. The training materials they have (Now You're Talking, videos, etc) are good, but we need something to get people interested in the first place. How about a series of posters we can hang on our walls, or 8x10s we can put in our cubes at work. Tasteful artwork perhaps, that would prompt people to ask about it and give you an opening to discuss amateur radio.

Flyers to place at the local rat shacks (maybe with a blank space for local club name/address info) would be nice too. I've seen a few things on the ARRL web, but they could stand to get a LOT more.

73's,

Robert / N4IXT

at least 1 per minute being posted, excluding the 6 meter spots.
Including them and the average is better than 3 per minute. This
particluar cluster nly posts about 60% of all the internet spots, so
there are considerably more out there. And this is just what is being
posted, so there are even more people out there on a traditional
business day in the US at 10am BST (bill sohl time)

Guess Bill needs a better pair of ears (read antennae) cause I hear
almost 90%of all these posts plus a lot more

Just remember..it's 10am somewhere in the world. That leaves 23 other
hours to be elsewhere. The fact Mr. Bill OOOOHHHH NOOOOO categorically
states that when it's 10am business time in the US that the rest of the
world is also experiencing business hours shows a total lack of
understanding in things DX

at least 1 per minute being posted, excluding the 6 meter spots.
Including them and the average is better than 3 per minute. This
particluar cluster nly posts about 60% of all the internet spots, so
there are considerably more out there. And this is just what is being
posted, so there are even more people out there on a traditional
business day in the US at 10am BST (bill sohl time)

Guess Bill needs a better pair of ears (read antennae) cause I hear
almost 90%of all these posts plus a lot more

Just remember..it's 10am somewhere in the world. That leaves 23 other
hours to be elsewhere. The fact Mr. Bill OOOOHHHH NOOOOO categorically
states that when it's 10am business time in the US that the rest of the
world is also experiencing business hours shows a total lack of
understanding in things DX

> technology than is Morse code.

Even if true, that's NOT necessarily a reason to require that it be
tested
for an amateur license.

I'm being devil's advocate here, of course. But it's interesting to
see how this line of arguing would go.

There are many more hams using Morse code today than there are hams
building
their own "modern radio technology". Yet the FCC has clearly stated
that while
Morse code is good to know, there is no regulatory reason to TEST for
it other
than a treaty provision.

They could just as easily say that while electronics theory is good to
know,
there is no reason to TEST for it beyond the level necessary for rules
compliance and public safety considerations.

The FCC could say that there is no correlation between taking more
theory tests
and being a better amateur radio operator, as evidenced by who gets
the NALs.

There was a time in the past when some theory knowledge was necessary
because the "modern radio technology" of that time required that
transmitters be
carefully adjusted to avoid spurious and out-of-band emissions. That's
not
the case today. FCC could cite that simple fact.

I remember when commercial radio licensing included a whole array of
licenses and endorsements, like First, Second and Third 'phone and the
radar endorsement. Not to mention the Telegraph licenses. What's left
besides the

GROL today? FCC could argue that amateurs are expected to use good
technical judgement and leave it at that.

Come up with more arguments and there are counterarguments that the
FCC can use.
>
> Had Amateur Radio started out by being not relevant to modern radio technology,
> it never would have gotten off the ground.

History does not bear that out, Ed.

How was early amateur radio "relevant to modern radio technology" in
1912, when the first real radio laws were written? Or in 1919, when it
took a serious battle to get the govt. to reactivate ham radio?

Most of the other services wanted ham radio to go away - that's why we
got banished to "200 meters and down".

Of course hams made great strides in radio in the early days, and
often led the way to better methods. But that isn't what got amateur
radio "off the ground".

--

The real question is this: Does multiple-level theory testing cause
today's
ham radio to be more modern technologically than it would be without
such
testing?

And if a serious challenge to theory testing does arise, how will we
defend
most of what's in the writtens?

Where is this coming from? I live in what is probably the MOST congested area
(Los Angeles) and 98% of all repeaters in this area use PL/CTCSS as part of
their normal operations. This is across ALL bands where a repeater pair is
shared - and often where a pair isn't shared, a repeater still uses PL (or
some other access method such as DCS).

If you're saying that your area hasn't figured this out, you're 20+ years
behind the rest of us.

I knew you'd come around to the CW is needed scenario again.
Fine if it suits you. So far the disastor reports haven't shown any
absolute need where CW was THE only means possible. Some have
used it and that's OK...you do whatever you want.

> ""The best laid plans of mice and men......"

We each approach "being prepared" as we chose. I see very little
need, if any, to consider morse...YOU can do as you like.

Cheers,
Bill K2UNK

It's obvious that you still do not understand Shannon's theorem. If PSK31 is 50Hz wide and CW is 250Hz wide, the comparison is not a fair one. The only fair way to compare PSK31 and CW is to copy CW through a 50Hz filter. Do that and get back to us on your ability to copy it. (P.S. You won't be able to copy it unless it is dog slow.)

When two modes are compared you must compare not only power but also bandwidth and throughput.

Are you talking about comparing a 50 Hz PSK31 audio filter with a 50 Hz
IF filter at 455 KHz? Or are you talking about running 50 Hz audio
bandpass filters, both centered on the audio tone/note?

It never worked properly. It was a toy on 20 meters where it was developed by Tommy Lott, and neither Aerotron nor MACOM, the latter under under the "leadership" of Tio Carlos, the ex-FCC Bureau Chief, could never get it to work in a commercial setting on the "liberated" 220 MHz channels taken from amateur use and set aside for it.

It died a natural death.

The FCC *has* mandated a starting power, Dave. It is the minimum power necessary to establish a contact. Is it within reason to guess that if a station is in Europe, Australia, or some remote IOTA expedition, that 1500 watts is the minimum power necessary? If so, then why are so many other similar stations able to make the same contact under the same band conditions with much less? You are making unfounded, and out of bounds, assertions when you decide to just pump it up when you don't know you need to.

Well, let's see now. Dick's getting close to the Larry
Roll-type-impossible-scenarios, but let's entertain his drone, above.
Nearly everyone--ham or not--recognizes SOS. Nearly *any* ham can DF a
signal, and quickly at that. If Bill's close enough to Dick as Dick hammers
out an SOS, then poor 'lil Dick will be rescued.

On the other hand, I'll hope that the rig he gets near in a disaster isn't
SSB only. He'd probably waste precious time trying to rig up something for
CW.

I suggest that if the ability to go from 1500 watts to 100 watts is all that difficult for the ham, then that is a poor station setup. Most folks seem to
be able to just shut down the amp and run fine. The ham in question was (IMHO) a poor op. You can come up with all your ifs and maybes...it doesn't change what went down that day.

SUGGEST?? SUGGEST Are you even speaking from experience? I seriously doubt that Bill. You have no clue do you other than your vaunted opinion that amounts to zip. Poor station set up huh? This coming from an appliance rice box owner no doubt.

Better yet, go ahead a describe what it takes for going from 1500 watts (which is 1/2 again as much as you originally stated)..down to 100, cause just turning off the amp ain't the answer Bill, but then again you wouldn't know that would you Bill?? Sounds like power envy to me. Poor Bill ain't gots no amp so everyone who has one is a poor operator...you are your parties candidate.

OK BILL you win. Be like the rest of monkeys. Hang onto your banana and keep screaming loud. Sooner or later someone will answer you and you can whine to them about poor operators

What an a**

Are you really that clueless? Of course we know Shannon's plan, but that has nothing to do
with real world communications. Are you rationally suggesting that when someone can copy
the
CW but not the PSK31 that he should kill the CW too by running it through a 50 hz filter?
That
just shows how far out of contact you really are.

Once again- that this all proves is that, like the race doesn't alway go to the fastest,
the
communciations doesn't always get done by the most theoretically efficient.

> Robert / N4IXT

Robert, Amateur Radio started going into the toilet in a flying leap
as soon as the ARRL petetitioned the FCC to publish the Exam
Question Pools. The reason for this was ARRL was losing revenue
from their testing study guides to the infamous "Bash Books".
In short, the ARRL screwed Amateur radio in the USA just so they
could put Dick Bash Publishing out of business. Their mentality at
the time of this was: "How dare he! We are the ARRL and WE are
the Gatekeepers of Ham Radio". In their rush to save face and act
like a child having a temper-tantrum, they SCREWED ham radio for
good. As a result today's "hams" can't even comprehend Ohm's Laws
let alone calculate Power Factors or (glub forbid) interpret a Smith Chart.

It's now 'plug and play' ham radio - although the kids are LONG GONE
to the internet. After all who want's to spend a kilobuck and put up
unsightly antennas when for about $400 you can get a Pentium-III and
interact with the world over the telephone line or thru the cable tv..??

Stick a fork into it Rob. It's cooked and ready for dinner.

Ken (callsign lapsed in disgust in 91)

Ed/Jim/Arnie:

RRAP is far from "dead." Heck, you haven't even seen the demise of the "...one step closer to extinction" thread -- there's plenty more where that came from! rec.radio.amateur.policy will probably outlast the ARS itself. More on this later, gotta get ready for work -- snowstorm predicted for later this afternoon -- yuck!

>employee is to be viewed by the leading edge guys as "retro", holding beliefs
>in
>anything but leading edge, ya know, stuff that can generate big bucks.

Hey Dick,

What's wrong with "retro?" I personally think there's room for both. By all means, include PSK31 questions on the written exams. But to completely remove Morse testing? What's next...Ohm's law? I know that's a little extreme, but I hope that you get my meaning. I agree that NCI's "justifiable" mission was already accomplished with the NCT ticket. (I don't even know if NCI's been around since 91?) I don't particularly agree with the "total" reduction in code speeds either. (Probably should've kept 13 w.p.m. for the extra.) But at least you could get a ticket without having to demonstrate CW proficiency and had 50mhz & above as your playground. If I remember correctly there were actually entire magazines devoted to MF & above. (Maybe VHF) Sorry for the pseudo-rant, just MHO.

>Not good for
>your career path.

I've seen this in my former state of NJ...as long as you keep your nose fairly clean (i.e. not committing murder.) your "G" job's safe.

>Plus Government guys gotta spend money, geeks gotta constantly
>come up with "stuff" to sell us all, whether or not we "need" it. Makes the
>world
>go round
>.

How about that nifty little gizmo that's supposed to "shield" you from the harmful RF radiation that's emitted from your cell phone? Work of technological wonder, eh?

>So when the FCC employee, who wouldn't be caught dead admitting that CW is a
>good
>real life communications mode, in spite of the fact that it has served as
>such for
>over a hundred years, made the decision it was pretty well cut into stone. No
>matter what the facts really are.

I still think that if the FCC were petitioned via the RM process by 700K ARO's, (+/-) they might be influenced. .-. .-. .-. re. the actual decision vs. what

the "majority" wants. Remember my little rant on RM-9807? (Remove the 250km distance limit on CB.) The FCC admitted that the "majority" of CBers were in favor of dropping the rule, however...? (At least they had S25.5 to fall back on.) I think it'd be really interesting if such a "retain 5 w.p.m.testing for HF privs" petition were set up via internet and paper ballot. Unique callsigns preclude any "stuffing" of the <electronic> ballot box. I don't think it'd cost THAT much and it just might "make" some aspiring ARRL hotshot's career. (Even if it failed. the mere attempt would likely be widely applauded.)

The really interesting thing would be if the code were dropped despite an overwhelming protest thereof by the "affected constituency." Then bend the ears of your local congressmen (or women) and senators and ask them why the democratic process was completely ignored? Oh well, I apologize again for the pseudo-rant. Not bad for a pro-11 meter guy, eh? Take care and 73.

Mark

If one learns Morse code, but does not put together a station, he or she is not prepared to conduct emergency communications.

If one puts together a station, but does not learn Morse code, he or she is prepared to conduct emergency communications.

If the issue really is emergency communications, it would be better for the FCC to mandate that hams have stations than for the FCC to mandate that hams learn Morse code.

Agree 100%, they missed a great chance to promote after 9/11. I did see
a ham artical in our local paper shortly after 9/11 though touting ham
comms during disasters. A local club must have called the paper.

But why? Isn't MF & above enough? For a lousy 5 w.p.m. you get HF access thereafter. I just don't get it, Bill? What if we encouraged kids in college to use the same analogy. I'm going to be a doctor, so why do "they" (That'd be society, Bill.) force me to take history classes too? Poll the AR community. I think you'll find this segment of "society" adverse to "giving it away." Oh, you don't think that it about what already licensed ARO's want? Then go poll high school seniors on whether they want less work for the same college diploma. I don't think their future employers will appreciate the "up"coming graduating class. Gee, perhaps an OT might feel the same about sharing the "bottom of 20" with a "codeLESS" extra? Just something to ponder.

I think that someone calling CQ is well warranted to use 1500 watts. It is what happens once contact is made that determines whether the law to use the mininumum necessary power is followed.

You don't have to get it. The FCC is the one that counts.
Agree or not, there simply is NO reason for a separate
morse skill test anymore...at any speed.

Add fundamental morse/CW character knowledge to
the written if you want (e.g. The morse characters for the word
HELP are?: and have 4 answers to pick). The int. phonetic alphabet is
part of the question pool on the same basis.

> What if we encouraged kids in college to
> use the same analogy. I'm going to be a doctor, so why do "they" (That'd
be
> society, Bill.) force me to take history classes too?

Frankly, I don't care if history was dropped from doctor's academic
requirements (it probably isn't there anyway as history wouldn't
be a med school class, but rather an undergrad class). Regardless,
that's a social/academic issue...take it up with those folks. The issue
as you see it (IMHO) is one of having requirements just for the
effort needed, rather than for a valid reason.

> Poll the AR community. I

Did employers get upset when engineering colleges stopped teaching
use of the slide rule once calculators/computers became "standard."

> Gee, perhaps an OT might feel the same about sharing the
> "bottom of 20" with a "codeLESS" extra? Just something to ponder.

YOU can poll anyone you want. The FCC makes the decision and that
is the process. As to an OT sharing the bottom 20 with a codeless
extra...so what...they do that now with 5 wpm extras. This isn't
about OT "feelings" it is about what are the proper requirements
for a license...and morse isn't one of them anymore (IMHO).

If Morse testing were simply treated equal to the testing of any other mode,
there probably would never have been any opposition. The fact that the Morse
exam is a stand-alone pass/fail exam while everything else in amateur radio
is another stand-alone pass/fail exam is the basic problem.

And, not that you need or want my reinforcement Bill, but I agree with you. Good station installation considers first the rules, then the convenience of how to work within those rules. If tuning is required with a carrier because one does not have a dummy load (and I know few hams who do), then just be sure to ID (and I know many hams who don't) when you've completed each step of tuning. Listen to a MARS frequency prior to net time some evening. One carrier after another. Listen to a DX pileup. You'll hear the intermittent carrier tones.

I don't know why this Jay person has chosen to take up the cause of ignoring the FCC R&R, but I do know that they are there and we are bound to them if we are to operate properly. It's as simple as that, no matter how much of an inconvenience they may be at times. If the ARRL gets on the air at full power without, shame on their station. Is there some set-aside that makes allowance for that? I only wonder because I don't think their station is trying to establish contact, is it, when they are running bulletins, etc.?

Jay: with all due respect, you keep protesting following FCC R&R for the sake of "inconvenience" when operating. It doesn't matter "what it takes" to meet the FCC R&R, it matters that we meet them.

Why would you be so vehemently opposed to someone who is SUGGESTING that rules be followed? It has nothing to do with envy. It has everything to do with knowing the R&R and following them.

IMNSHO, I believe it's a bad analogy in these debates to begin comparing educational requirements to those of getting an amateur radio license. While the ARS is in the *avocation* [read: sideline] of providing community services, there is absoulutely no requirement whatsoever that a ham radio operator do so. While the ARS is in the *avocation* of experimenting with electronic theory, there is absolutely no requirement whatsoever that a ham radio operator do so.

An MD is not in *any* avocation, as related to his education. An MD is in the *business* of diagnosing, preventetive medicine, and treatment--on *HUMAN BEINGS* for the sake of this discussion (not counting those who are veterinarians, etc.)

Most people who take formal education are taking that education to then apply what they have learned to some area of professional life.

The ARS should *not* be in the business of being so discretionary when judging how important one is by how they got their license or what they do with it once they get it. Just as we, as people, should not be in the business of saying that someone who joined the Boy Scouts but never became an Eagle Scout is some kind of moron for not having done so. Or, that a gardener who has never introduced a new rose because they've never experimented with grafting isn't a *real* gardener. Or, that someone who simply drinks herbal teas and has never studied any further is simply just not worthy of the flavor or experience of those teas. All these things are,

basically, hobbies--and we decide when entering these hobbies just how "devoted" we will be to them.

The ARS is not a measure of intelligence, success, or even influence. It is a hobby, gentlemen, first and foremost. Be it good or bad, I believe the FCC is recognizing this more and more. In earlier times, there was certainly a lot more to being a ham. It was still a hobby, but those who engaged certainly were among the elite. The knowledge it took to create a signal that was received in distance just wasn't commonplace. Nor is it today. But, and I say this with great dread to the anger this inspires, it is not needed today. Before you begin to defame someone the next time you get angry because they worked differently than you did to get your license, just think about all the new things that have come out since you got your license. Then, ask yourself if you understand so well how those "new" modes work, and how to experiment with them.

>
> Poll the AR community. I
> think you'll find this segment of "society" adverse to "giving it away." Oh,

> diploma. I don't think their future employers will appreciate the "up"coming
> graduating class. Gee, perhaps an OT might feel the same about sharing the
> "bottom of 20" with a "codeLESS" extra? Just something to ponder.
>

Educational requirements belong in the educational environment. Schools need to be tougher; teachers need to be freed from half-assed curriculums to get back to teaching with finesse and style; colleges need to start turning out pure genius in their field. BUT, the hobby arena is not the place to demand such stringent things of people. The hobby arena is the place people come to "get away" from the pressures of education and profession. The more you fight to try to make it some kind of educational arena, the more you'll find the youth staying away. They've got enough, without hearing and listening to how incompetent they are because they only want a hobby and nothing more.

Why is it that great philosophers, inventers, speakers, scientists, musicians, etc., why are they almost always *not* from the United States? Everything here in the United States is so very judged--we demand perfection in everything we do; when sometimes all we need and want is to just "pick up a microphone and argue, or chat, or frolic" [in the case of amateur radio]. I know many Europeans who come over here and are at first amazed, then feared by, our work ethic; our harried lifestyles; and the way we choose to "enjoy" ourselves.

>
> Mark
>

I don't have much of a stake in this debate. I've already got my license, I have fun with the privileges I have, I haven't even tapped the many things I could be doing with what I've got. I don't care if amateur radio grows or not. In fact, better that it does not, in my opinion, because the spectrum is crowded enough as it is (I am more saying that as Devil's Advocate than anything, but it *does* have some truth), and I don't believe that our children are going to miss anything by choosing to be engaged in other things than amateur radio--in fact they've a better chance of interesting Mother and Father, and church and community, if they *do* get more involved with computers, networking, etc., than with amateur radio.

All that having been said, the CW debate has become, IMNSHO, the pariah of amateur radio. I believe that if we wish to interest people in ham radio for the benefit of either getting them involved, or simply to help them understand the importance of the hobby, their former knowledge of the CW issue brings to surface the worst in ham radio. And, when you think of where we probably draw our greatest interest from (scanner listening, our affiliation with public service groups, police and fire organizations, and forums like this), we've shot ourselves in the foot. Just my two cents worth.

> >
> > > > Dave Heil wrote:
> > > > NCI is an small, loose membership organization
> > > > with a non-elected board

First, I don't consider thousands of members in over
60 countries, with active National Chapters in a number,
to be "small." (Admittedly, we're not as large as, for
example, the ARRL, but we haven't had 70+ years to
achieve that level of growth either ... and we don't try
to be "everything to everybody," which is also a factor)

Additionally, I feel compelled to comment on Dave's
assertion that NCI has a "non-elected board" ...

The original board was selected from volunteers by
the founders. (necessary to get things started ... and
not uncommon in theformation of new organizations)

Subsequently, when the original terms outlined in the
Bylaws were due to expire, the entire membership was
solicited for nominations in preparation for an election
(if necessary) of board members.
(This was done by notice on the NCI website, as well
as direct e-mail to the membership.)

Apparently, the membership was happy with the policies
and performance of the original board members, as nobody
from the membership chose to contest the re-election of ANY
of the incumbent board members.

Before Dave (or someone else) goes off on this, I'd hasten to
point out that the ARRL does things the same way ... if an
incumbent seeks re-election, and at the end of the noticed
nomination period there are no additional candidates, the
unopposed incumbent is automatically declared re-elected.

> > > > and no membership votes on anything. It can't love or hate
anything.
> > > > Its views are the views of the directors.

The membership of NCI has been polled on several occasions
by e-mail, soliciting their views on issues.

Also, the e-mail addresses of the NCI Directors are published
on the website and it has always been made clear to the
membership that they are encouraged to write with questions,
comments, suggestions and (yes) any criticisms.

This is consistent with the way ARRL "does business" ...
I don't recall being asked to vote on specific issues ... the
ARRL board is elected and makes decisions, presumably
based on some combination of their judgement and input
received from the membership. NCI has the "luxury" of
not trying to be an "everything to everyone" organization,
thus, the membership views on the Morse issue are pretty
consistent (otherwise, they wouldn't have joined in the
first place).

To be candid and honest, member comment has always
been quite postitive and the membership continues to
support the organization financially as well. (through
completely voluntary donations ... not mandatory dues and
a popular magazine subscription that is inseparable from
membership ...)

> > That's all well and good but if the directors go off on a tangent
and
> > begin addressing other issues which are not part of posted policy,
they
> > are not being given a voice as to whether they are in agreement.

> Why do you think an NCI member has no voice. We (the NCI
> BOD members) do recieve input from the members throughout
> the year...as does ARRL directors.

Again, the e-mail addresses of the NCI Directors are published
on the website and it has always been made clear to the
membership that they are encouraged to write with questions,
comments, suggestions and (yes) any criticisms.

> > There is no known mechanism for "unjoining".

> Anyone that wants to "unjoin" is free to do so. A simple request
> by email or snail mail will suffice.

I guess Dave doesn't (or doesn't think others) know how
to send an e-mail.

And something on the order of 5-10 individuals have
done so over the past several years, out of thousands
of members worldwide.

Any member who asked to be removed from the
membership rolls was personally queried by me
by e-mail as to *why* they wished to resign their

membership in NCI (because the board CARES
about member's views) and asked politely if there
was anything that could be done to resolve any
issues to their satisfaction.

A few indicated that now that 5 wpm is in effect, they're
happy enough ... a few were upset that NCI felt that
5 wpm as an interim measure was "the best we could
expect at the time," stating they joined "No Code Intl."
not "5 wpm Intl." A couple were just trying to trim e-mail
traffic or were concerned about the privacy of their e-mail
address.

Everyone whose issue was not resolved to their satisfaction
has had their request honored though, as stated, the numbers
have been vanishingly small.

And NCI's membership continues to grow steadily ... the
establishment of National Chapters in other countries has
had a particularly postive effect ... for example, membership
in the Netherlands (which was already pretty good) doubled
rapidly after the establishment of a National Chapter there
(and continues to grow).

All of this tells me that the NCI board is doing a pretty
darned good job of following the wishes of the membership.
(Which is something I'm proud of every time I receive an
e-mail from a member saying, "Keep up the good work,
thanks for your efforts.")

That happens in government elections, too, Carl. It is the normal way of handling these sorts of things.

>is another stand-alone pass/fail exam is the basic problem.

One can get all of the safety questions wrong and still be given a license.
One must answer 7/10 of the Morse code questions to obtain a license.

There have been proposals put forth to treat Morse code the same as other modes
in the exam process, but those proposals do not have the support of either
side. The NCTA folks believe that their view will prevail and the NCTA folks
believe they have compromised enough, by my read.

The end result is that it will be one way or the other is my guess. Too bad,
because those compromise positions that keep some code testing have merit,
IMHO.

> > by email or snail mail will suffice.
>
> So even the dead can remain as members until they speak up?

The e-mail addresses of SKs tend to become invalid rather
promptly ... there are some SKs in the membership database,
marked as such under "license class" sort of "in memorium."
(The numbers are small, and there is every reasonable effort
made to identify SKs and mark their member record as
such)

It is NOT NCI's intent to missrepresent numbers on
the basis of the "votes" of SKs ... this is not Chicago :-)

(I wonder how many ARRL members are SK without the
ARRL knowing it? I suspect the number would be much
larger both in absolute terms and as a percentage.)

One of NCI's SKs in particular, a ham in the Netherlands,
died of cancer a year or so ago, shortly after joining NCI.
When I was notified of his terminal condition by the National
Chapter Chairman, special arrangements were made to
send an electronic copy of his membership certificate to
our National Chapter Chairman for local printing and personal
delivery in his hospital room by the National Chapter Chairman
a few days before he passed away.

The National Chapter Chairman later indicated that his XYL
had asked that the message be relayed back to me that
this special effort meant a lot to him.

Yes, we DO care about our members ...

>
>
> That's a BIG exception.

What's so "BIG" about it, Dave? In my view, the idea
that QST suscription is inseparable from membership
in the ARRL quite arguably inflates "membership,"
since there are quite likely quite a few "members" who
are actually more accurately characterized as "QST
subscribers."

I obviously don't know the exact extent of this
phenomenon, but I personally know quite a few folks
who only renew their ARRL membership to keep
getting QST ... I am NOT one, BTW, and this is NOT
meant to be a "dig" at the ARRL ... just pointing out
the flaws in your argument that the fact that NCI doesn't
have mandatory, fixed dues is somehow a "negative
indicator."

Want to bet that, with that particular shift in position,
the ARRL will see an increase in membership from
those who perviously felt quite "disenfranchised" by
the ARRL's former policy on Morse???

No way to tell.

What we've really got is a mess of different effects all overlapping:

- Change to 10 year licenses & 2 year grace period (1984)
- Code waivers (1990)
- Tech loses its code test (1991)
- Vanity calls for all (1994?)
- Restucturing (2001)
- Renewal/no renewal with upgrade/modification (?ongoing)
- Renewals only allowed within 90 days of expiration (?)
- TIN/ULS/FRN 610/605 and other alphanumeric soup (ongoing)

With all that going on, who's to say what's what?

Not really.

What bothers me most is the way the BoD came to their decision, and their soft-peadling of it. If they think it's the right way to go, let them stand up and be counted.

But what the heck do I know - I'm just a long-time (34 years) member.

This is the same FCC that did nothing about enforcement for years. The same FCC
that gave us an NPRM with four license classes and better written tests, then
chucked it all in the R&O. The same FCC that renews Tech Pluses as Techs. The
same FCC that will give Element 1 credit to anyone who can show they held a
Novice at one time, even 50+ years ago, but WON'T give the same credit for
any other license class beyond the grace period, or a CSCE for Element 1 that
is 366 days old.

The list goes on and on, but you tell me I should "have faith in the FCC".
Right.

Ed,

Due to the fact that the exact number of NCI members varies
literally on a daily basis (substantially more by new members
joining than by the handful of those who have "dropped out"),
NCI has never quoted a specific number to the FCC ... nor do
I believe does the ARRL in its filings ... however, we have
never missrepresented the general magnitude of NCI's
membership, either to the FCC or in any other forum.

The FCC and other national regulatory agencies know
we're not as big as the ARRL and we've never tried to
"BS" them that we are ...

Look, simpleton cum genius, what *I* want is the system that works when I need it to work. If I
have a transmitter with X watts capable of working a PSK mode and CW, and the PSK won't fill the
communications requirement when the CW will, it doesn't take a lot of comparing or rationalizing to decide which to use. The decision is already made for you.

That's a really idiotic word game, Dick ...

The point is that the original board was elected to another
term (following the intial one) without ANY opposition ...
following the (publicly viewable) procedures outlined in
the Bylaws ...

Tilt at another windmill ... this one's quite sound and
won't collapse.

Which is really NOT a problem when one considers that radiotelegraphy is the most basic radiocommunications mode which should be a required skill at SOME minimal level for ham radio ops, at least at HF.Personally I believe it should be required of all hams.
Of course in this jimmy-gimme, plug-and-play society anything that requires effort is taboo.

Use the pickup truck. You do have vehicle redundancy, don't you?
Or what the hey, just call the neighbors. The phone still works.

>

Ed,

You are exactly right ... there were no contested seats on
the NCI board, despite the membership being duly noticed
that nominations were open for any member who wished
to serve on the board.

Since there were no contested seats, the unopposed
incumbents were declared elected to another term,
per the provisions of the Bylaws (much the same thing
takes place in the ARRL when an incumbent is unchallenged.)

As you point out, there is absolutely nothing wrong with this.

In fact, based on the lack of challenges, the (fairly
considerable) amount of positive feedback from the
membership, and our continued membership growth,
I'd say that all indications are that the the NCI board
is representing its members' views and desires rather
well (something I'm proud of and I believe the other
NCI directors also take some pride in ...).

As far as election procedures are concerned,
it's not yet time for another election. Members
will be duly notified when it's time, and the provisions
of the bylaws will be followed as before.

73,

But it does not preclude getting an amateur radio license.

>One can get all of the safety questions wrong and still be given a license.
>One must answer 7/10 of the Morse code questions to obtain a license.

Does anybody know how many characters are sent total during the five minute period of the 5-wpm exam? I'm guessing approx. 150. (...and that's being really conservative.) Let's divide 100 by 150 and multiply the result by 25, which is the amount one must get in a row within said 150 to pass. Kind of puts it in perspective, doesn't it. Gosh, I don't think I'd be too proud of fighting for the removal of an exam for which the passing grade was a 16.7. (Yuck!)

>The end result is that it will be one way or the other is my guess. Too bad,

and no more
> than 250W on the rest of our allocations, including UHF and above.

I *personally* (not as an NCI position, because it's NOT) would
support a reduction in power limits, though I don't see why 500W
would apply to the lower frequencies and 250W for everything
above 40m ... path loss increases with frequency, so I don't see
why you're advocating higher power for 40m and below ...

I *personally* could be satisfied with a 250W limit ... as I've said
(over and over :-) there is far more "bang for the buck" in better
modulation and coding techniques (and antennas, as you point
out) than in brute force power.

However, if you propose this seriously to the FCC, I'd
recommend that you have a consierable amount of
suitable solvent on hand to remove the liberal amount
of tar and feathers I expect would be applied to you
by those whose "God-given right" to run (the current)
legal limit to talk a few miles on 80m (despite the
"minimum necessary power" rule) you propose to take
away :-)

One (and only one) of the points discussed was that Morse
is no longer the only mode more robust than SSB (many
digital modes are, with even better performance than Morse).

Again, the MAIN (and most compelling from a regulatory
perspective) argument for eliminating Morse testing
is and always was that it is no longer justified as a legitimate
regulatory requirement for obtaining a license with full HF
privileges.

Actually Cecil, that IS a better analogy. But you forgot to mention that it applies to the equestrian hobby, or perhaps a rescue worker trying to "earn" (Key word alert!) additional endorsements who happens to work in rough forboding terrain. Not society at large.

This happens to be about the radio hobby. So given your analogy, I'd say "earning" some additional "privileges" via a not-so-challenging 5-wpm is quite reasonable. Thanks Cecil.

This doesn't even account for the apparent attitude Dick C. has that it's OK for him to point up wordplay and terminology, but not for anyone else. But, in terms of what I've come to expect to see in Dick C.'s posts, it's also nothing of surprise.

Output power *could* be "enforced" by making it
a prima facia violation to possess a transmitter
capable of producing more than the allowable
output power ... antenna gain is measurable,
of course, but with more difficulty.

> And after it's all said and done, whether the ERP comes
> from amplifier gain or antenna gain, it's still the same ERP

I think the "high sounding bias against big guns" was
more a condemnation of a "stomp 'em into the dust"
mentality ... I know *I'm* not jealous of that sort of behavior
(and I don't believe Bill is either, though I don't want to
put words in his mouth as he's perfectly capable of speaking
his peace).

I wonder just how significant the interest is in QST. I get my QST and it lays around. When we shifted Section Managers I at first kept going straight to the back to see what was being posted there. It got so boring I've even stopped looking.

Don't take this necessarily as a slam to QST magazine, I just don't read it. My membership is for the benefit of people not being able to say "you're not even an ARRL member, so you have no voice." And that's *all* my membership is for. Let someone tell me I have no right to criticize a ham club, and I'll join that club also. Although, in both circumstances, I have learned that "joining" doesn't really mean a damned thing.

From: "Carl R. Stevenson" wa6vse-shack@fast.net

> path loss increases with frequency, so I don't see
>why you're advocating higher power for 40m and below ...

Free space path loss increases with frequency because the aperture of the reference, typically either isotropic or dipole, decreases with frequency. Typically, however, the gain of antennas used in practice goes up with frequency. If the capture area of the antenna were to remain the same, loss does not change with frequency.

Of course, ionospheric propagation is not free space, and losses tend to be higher at lower frequencies for HF. More important, the ambient noise levels tend to be higher on the lower frequencies than the higher.

I see no reason that the 1500-watt limit needs to be changed. I can quite comfortably live with the present power rules, including the mandate to use the minimum necessary power.

Well, there ya' go. If new hams need Morse code in an emergency, they can call you. That settles that one!

No, because if nothing else does, the monthly arrival of QST alerts the
family members to notify ARRL of the member's passing. Same with emailed
bulletins and newsletters.

Probably not many, Carl. Most ARRL members have to re-up, which very few silent keys are apt to do. Could be a few life members whose family still receives QST.

Hard to say, Carl. The ARRL position basically was not to expend ARRL resources opposing the dropping of an international requirement for code testing. That is a far cry from the all-or-nothing approach many on both sides believe should be taken.

And, to my knowledge, the ARRL policy on Morse code testing has not changed on the national level.

Ken, you can always come back. I let my call (N2JH) expire back in the early 80s. I decided to get back in 93. Quite easy, of course. If you actually know something, you don't have to look at the Q&A manuals. Of course, operating privileges have changed and I missed some of those - but you don't need to score 100%. In fact, I didn't bother answering the resonant frequency questions (oh, I just marked some boxes) as I had neither a calculator nor the inclination to extract square roots by hand. As far as a Smith chart, you can just plug numbers into your compooter. And get answers accurate to 18 decimal places (yeah)!

No, it's a matter of being prepared for operation with the *maximum*
feasible level of technical support. It doesn't do much good to
prepare for an emergency after it happens.

Used gear can usually be had at affordable prices, but there's a
catch.

The 800 SMR frequencies were set up with a 45 MHz "split" and
many, if not most, commercial mobile radio units use a 45 MHz
IF to simplify the synthesizer arrangements ... thus, it would be less
than trivial to convert much such gear to work in the 902-928 MHz
band (where such a split would not be possible), even if the front
end resonators and other parts of the radio would easily tune up
there.

Gee ... I'm REALLY disappointed to hear that ... since the
company I work for has a leading market share in the world
in IEEE 802.11b products which run 11 mbps in the 2.4 GHz
ISM band ...

In fact, the notebook at the operating position
that I'm typing this message on is linked to my 100 mbps
switched hub Ethernet LAN by an 11 mbps 2.4 GHz
802.11b link from a PCMCIA card in the notebook to my
802.11b residential gateway ... that box provides the
connection to the outside world for both wired and wireless
devices , dishes out DHCP addresses for both wired
and wireless devices, and bridges the wireless clients to the
other computers on the wired LAN here in my home office,
ham shack, and electronics lab.

I'm REALLY disappointed to hear that it doesn't work
(ROTFLMAO!)

I'll have to tell the 1000+ engineers at the IEEE Project
802 LAN/MAN Standards Committee meeting in Dallas
that I'm attending this coming week the bad news :-)
I'm sure that they'll be equally disappointed to hear that
none of our products work :-) (ROTFLMAO!)

Jon ... I was not infering that the ARRL wasn't diligent in
noting SKs in its' membership ... just that, since the ARRL
has a much larger membership, the absolute number of
SKs in the ARRL membership would be larger. Additionally,
though I didn't express it, my intent was to point out that
I suspect that the demographics of ARRL membership
vs. NCI membership (more older hams in ARRL than
NCI, I strongly suspect) would tend to make the percentage
of members going SK larger as well.

I certainly didn't mean the comment as being negative
towards ARRL in any way ... if you took it that way, please
accept my sincere apology.

Jon ... don't you think that more hams will join ARRL now
that it's taken a more "mainstream" position on Morse
testing? (I do ... and that doesn't bother me at all.)
I'd suggest you consult with Ed on the dangers of wagering
with me :-)

Jim ... since Ed likes CW and I don't, it seems only fair that we
should be able to eliminate Dick (who also likes CW) from the
equation in order to keep balance in the universe :-)
(What do you think, Ed?)

<wa6vse-shack@fast.net> writes:

>First, I don't consider thousands of members in over
>60 countries, with active National Chapters in a number,
>to be "small."

How many thousands? How many national chapters?

If you have 2000 US hams as members, that's something
like 0.3% of the US amateur radio population. That's
"small" for a national/international organization, no matter how you cut it.

>(Admittedly, we're not as large as, for
>example, the ARRL, but we haven't had 70+ years to
>achieve that level of growth either ... and we don't try
>to be "everything to everybody," which is also a factor)

ARRL is 85+ years old.

NCI is a one-issue organization - but there are no dues.

>Also, the e-mail addresses of the NCI Directors are published
>on the website and it has always been made clear to the
>membership that they are encouraged to write with questions,
>comments, suggestions and (yes) any criticisms.
>
>This is consistent with the way ARRL "does business" ...

Not really.

ARRL doesn't have a "loyalty oath" where all prospective members
must agree on specific issues in order to join. NCI does.

Since NCI is composed entirely of members who agree
with its single stated purpose, it's no wonder there is little dissent.

>And NCI's membership continues to grow steadily ... the
>establishment of National Chapters in other countries has
>had a particularly postive effect ... for example, membership
>in the Netherlands (which was already pretty good) doubled
>rapidly after the establishment of a National Chapter there
>(and continues to grow).

If there was one member, and another joined, membership doubled ;-)

Point taken ... that *could* be used to justify a higher power at
the lower frequencies ... though I'd still *personally* be content
if the FCC decided that 250W was a better limit than 1500W.
I think that more people would start thinking more about using
more effective modulation/coding if they were faced with a drop
in the allowable output power.

> I see no reason that the 1500-watt limit needs to be changed. I can
quite
> comfortably live with the present power rules, including the mandate
to use the

I'm not *pushing* for a drop from the present limit, more
just stating that I don't think it would be a bad idea and
could have beneficial consequences in the long run ....

In an emergency, what good are a bunch of drivers without vehicles?
Well, then too, maybe they could cobble together a working
vehicle with bits and piees found around the house :-)

Cheers,
Bill K2UNK

> you guys do?

Keep lobbying until it is ... although I don't anticipate that
the FCC will find any reason to keep Morse testing once
S25.5 is gone, since in the R&O in WT Docket No. 98-143
the ONLY reason that they cited for keeping any Morse
testing at that time was the existence of the treaty obligation
under S25.5 of the ITU Radio Regulations.

> In other words, what will be the purpose of NCI?

In your (unlikely) scenario, the same purpose as now.

the other.)

I guess you haven't seen the posts outlining why the FCC
has a public interest mandate to make such decisions on
the basis of what's best for the ARS, represents the minimum
necessary regulation, etc. Such decisions about how public
resources (in this case the spectrum allocated to the ARS)
should not be a "popularity contest limited to the incumbent
users." (That's sort of like allowing the fox to guard the hen
house ...)

Dick,

The "geek dealing with ham radio at the FCC" (your words, not
mine, of course) happens to be a 20 wpm extra whose main
interest in ham radio operating is CW DX ... I honestly don't
know what his country count is, but I'd be strongly inclined to
believe
that it probably exceeds yours. I've NO doubt that his level of both
technical knowledge AND operating skill FAR exceeds yours.

Did you mean to say PCTA beilieve they have compromised enough?

Assuming that makes a more logical statement, I'd suggest
that the history of the events indicates there was NO compromise
ever offered by the PCTA. The final R&O from the FCC
was exactly that...an FCC dictate...not the result of NCTA and PCTA
folks working a compromise. Indeed, had a true effort
to compromise been on the table, then I'm sure an element of such
negotiations would have included an agreement NOT to challenge
the compromised position by either side for N period of time.

No, there was no compromise ever offered, and there is, therefore,
no reason for NCI to consider that the current status quo need be
viewed in any such light. NCI will keep working towards our end
goal.

> The end result is that it will be one way or the other is my guess. Too
bad,

Well, as Reagan would have said...there he goes again. It is
only YOU that makes the dumb DX KING reference.
Separatetly, the ARRL has a long, well established history,
and full knowledge/consent of the FCC to do what they do...and
the BIG difference is the ARRL transmissions are intended for
distribution globally. That's a far cry from a ham in Ohio

ragchewing with a ham in NJ.

I'll state it again...IF a ham can't decouple the AMP operation without
a major bit of effort, then that is poor setup.

> Better yet Councilman, send a complaint to Riley. I am sure he'll act
> on it immediately seeing as you are such great friends with the FCC.

Clearly your ability to discuss anything rationally is a test of
your faculties... you appear to be running off at the mouth so bad,
you may be headed for a breakdown... rather than see you come to any
ill health, perhaps it is time to just leave you to your own keyboard
games.

No cheers,
Bill K2UNK

Since I've been refered to by the term "Squiggy" enough times
to infer that it's a derrogatory reference to me, would you care to
elaborate on just what the heck you think "the rest of the agenda"
is??? (Since there really ISN'T one, this should make interesting
reading ...)

And I predict that the total elimination of Morse testing
will result in an even stronger upturn, without a decrease
in the quality of licensees. In fact, I wouldn't be at all
surprised to see a noticable INCREASE in the quality of
licensees as more technical professionals, not interested
in Morse, but interested in the "new things" begin to join in
increasing numbers.

Yes, Steve ... one could actually hypothesize from that
with reasonable basis that there were PLENTY of folks
who were technically ready, willing, and able to pass
the general and/or extra written tests, but were unwilling
and uninterested in jumping through the high speed
Morse "hoop."

I think "I told you so" pretty well covers it ... :-)

In the LA area (where I lived for 20+ years and was trustee of
an amateur repeater, builder and maintainer of several other
repeaters, builder and maintainer of a couple of packet nodes,
and spent some time in the commercial 2-way business,
including operating conventional repeaters and an 800 MHz
SMR), I can tell you from experience that on the most desirable
sites (covreag-wise) there are several hundreds of transmitters,
and it's virtually necessary to use CTCSS to keep intermod
products from sporadically keying your repeater, if for no other
```

reason. (and this takes into account that most of the commercial systems are using antenna combining systems with ferrite isolators and the works to keep the IM products down ... but a rusty beer can laying against the chain link fence around one of the buildings can, in such intense field strengths, create some "interesting" products ... I've seen 9th order and higher IM products keying repeaters in that sort of environment ...

But the "blocking probability" can still be "unacceptably
high" in the eyes of those who want access to "their"
channel right away at any time of day or night ...

> THAT'S the problem that needs to be addressed.
>
> 73 de Jim, N2EY

The problem is that "everyone (group)" wants to have his(its')
own dedicated repeater pair so that they never have to deal
with (wait for) other users on a shared frequency ... this causes
repeater pairs to lie idle much of the time, while others could
be producively using them ... the "rub" is when someone else
who shares the channel has to wait for someone else who was
there first ...

The answer to that is in queuing theory ... the basis of the
telephone system (where the number of trunk lines between
COs is less than the number of subscriber lines connected
to each CO) and mobile radio "trunking systems," and the
"Erlang Equation" ... which when properly applied will show
that a MUCH larger instantaneous traffic offered can be
served with a VERY low "blocking probability" if each "QSO"
is dynamically assigned to a channel from a "trunking pool"
of multiple channels than in the situation where each user is
"tied" to a dedicated channel ...

In fact, in such a system, voice and data use could be
integrated, promoting much higher usage of channels,
while maintianing a level of service that would keep
folks happy ... even though the traffic loading would be

MUCH higher than the "dedicated repeater pair" system
could ever handle. The distinction between "voice channels"
and "packet channels" (and all the wars that go with that)
would disappear, because to the users, the system would
be transparent and more available. (thus no reason for
"turf wars")

I'm sure that if Dick sees this, he will chime in dismissing
queuing theory and the Erlang Equation as just so
much hogwash, irrelevant to hams, just as he has persisted
in doing with Shannon's work ...

I guess his motto is "Never accept the possible benefits
of technology you're incapable of understanding."

Ed,

I was talking "at any given moment" ... not long term ...
since folks seem to keep wanting me to tell them how
many SKs are in NCI's membership.

Let's see ... does anyone know if one of our members
passed away recently without telling me? (I certainly
hope none have, whether they told me or not ...)

The entire thing was, as I pointed out, not a "dig" at
ARRL in any way ... just using ARRL as an example
of another organization who will, from time to time,
unfortunately lose members to the actuarial facts
and may not, instantaneously, be aware of the loss.

>
> And, to my knowledge, the ARRL policy on Morse code testing has not
changed on
> the national level.

However, if I am right and the fact that ARRL has (at least)
taken the position of not opposing the removal of Morse
requirements from the ITU Radio Regulations (which I think
the "smart money" would bet will result in the widespread
elimination of the related requirements in national rules,
since many administrations have already more or less
said as much) leads to an increase in ARRL membership
by those previously "disenfranchised" by the ARRL's
position on Morse, the entire demographic of the ARRL
will change ... and the ARRL will have to take notice of
that ...

I have occasionally thought that one of the smartest things
we as NCI might do would be to actively encourage every
no code/slow code ham in the US to join the ARRL right
away and elect a slate of directors who would PROMISE
in no uncertain terms to vigorously support the elimination
of Morse testing in US rules as soon as the ITU Radio
Regulations permit.

You have an understanding problem: I'm talking about AMATEUR SS on 2.4, not commercial. Commercial (i.e. part 15) SS is allowed to hop above 2450 (up to 2483.5 MHz) and thus get away from the places where these NON-SS [jamming] part 15 devices work. However, also remember the range of your wireless LAN - it's measured in feet, not miles.

Trunking works in some cases - where the receivership is a particular group. However, as we know, many amateurs belong to more than one group. Furthermore, even with that, we sometimes get "random QSO's" from those who were merely listening, etc... The problem here would be how to coordinate everyone's radio to follow the system in a way where multiple conversations can be tuned in. We never really got cooperation on the digital packet network - it's more like constant anarchy - so what makes you think such would happen here?

Comparision to the telephone system may not work. That is a specific case of one-to-one. Radio can be many-to-many, but with only one person being able to transmit at a time, it's more like one-to-many, and in that aspect, there might be something applicable, but it's clearly a more general case than the one-to-one (or point-to-point) that exists for telco's.

I believe it's always been a measurement game. CW can be dressed up any way anyone wants to dress it up, but the core issue is always one of measuring how *much* someone worked to be a ham; and was a means to keep the "riff-raff" out of amateur radio, or so they thought--because it didn't work.

> You have an understanding problem:

I would assert that perhaps YOU do instead ... as Ed
pointed out, it's a shame that amateurs are not availing
themselves of some of the techniques (and perhaps even
inexpensive equipment) that's been developed in commercial
circles ... amateurs used to lead in technology ... now they
lag by something on the order of 20-50 years ...

> I'm talking about AMATEUR SS on 2.4, not commercial.

See the paragraph above ...

> Commercial (i.e. part 15) SS is allowed to hop above 2450
> (up to 2483.5 MHz) and thus get away from the places where
> these NON-SS [jamming] part 15 devices work.
```

In many cases (in larger networks with lots of access points
... that's base stations to many hams) the channels in the
lower part of the band are used equally with the upper part.
Probably the worst potential for interference in the average
amateur (residential) environment is the leakage from your
average household microwave oven ... which can be about
the equivalent to a 1W transmitter at 3 meters in the extreme.
Fortunately, that interference is generally concentrated in about
the middle 10 MHz of the 2400-2483.5 MHz ISM band so there
IS room for activity below it if it presents a problem.

> However, also remember the range of your wireless LAN - it's
> measured in feet, not miles.

Depends ... the range is up to about 1 km, depending on the
propagation environment (that's devices like notebooks with
PCMCIA client cards talking to an AP with, perhaps, something
like a "rubber duckie" ...) Now, at extreme range, or with
blockage, etc. the data rate might back off to as low as 1 mbps
in the extreme from the 11 mbps that's available when a decent
propagation path is available ... I cover my entire 5k sq foot+
house and then some with one AP (actually a "residential gateway,"
but the distinction is not significant to this discussion) at 11 mbps
everywhere ... it's been too cold to survey the coverage outside
very much ...

We also do building to building bridges with ranges into the
miles ... I recently did the link budget for a link from my house
to my employer's nearest facility ... about a 6 m path ... no
problem ... with standard output power of +15 dBm (about
32 milliwatts) and a 20" dish at each end, I had "link margin
to burn" for excellent reliability at 11 mbps ...

So, your assertion that ranges are "only in feet, not miles"
is incorrect.

This technology is inexpensive, reliable, and within the reach
of amateurs ... like Ed said, it seems a shame that more hams
aren't using it (or developing something like it ...)

I'm not sure its position is particularly "mainstream," but in any case
you're assuming that there is some significant number of hams who are
witholding membership in ARRL because of code testing. I don't belive
that. The few who may join becuse of that change of policy will probably
be offset -- maybe more than offset -- by those who drop membership
because of it, but I believe the numbers to be small in both cases.

Until recently, there was an impediment to such - the amateur rules themselves.
SS transmissions had to follow a specific sequence defined by the FCC, but
commercial equipment had no such restriction. The removal of the restriction
was so quietly done that hardly anyone noticed until some of us were made aware
of it here....

>> I'm talking about AMATEUR SS on 2.4, not commercial.
>
>See the paragraph above ...

But we are NOT permitted to avail ourselves to the equipment itself because it
GOES OUT OF BAND (see the paragraph you quoted below). Therefore, we can't

recognize the advantage of using this stuff with higher power, etc..., without substantial modification - which generally requires (besides skill) information (e.g. schematics) that the commercial manufacturers routinely DON'T PROVIDE.

>> Commercial (i.e. part 15) SS is allowed to hop above 2450

Wrong. My kenwood TM-2400 (the 2.4GHz version of a TM-742) has never picked up any noise or even an increase in the noise floor from my microwave oven 30' (and two rooms) away from it when both are operating.

You also failed to address the part 15 device problem on 2.4 that is caused by devices that don't employ SS but instead hog >1.5 MHz for their FM modulation. I have seen a cordless phone where the FM signal is CONTINUOUSLY spread (not SS) as wide as about 7MHz (in that case, it operated FM from 2421-2428 MHZ) and read almost full scale on my radio over the ENTIRE range, except for the last 100Khz on the ends. Any wide FM receiver could demodulate the signal.

That's still sufficient noise to jam an amateur signal where the transmitter is 30 or so miles away (or more), when the "noise" source is within a few miles of the receiver.

>We also do building to building bridges with ranges into the
>miles ... I recently did the link budget for a link from my house

>is incorrect.

Then why do manufacturers publish their ranges in feet. Also, your example is not consistent in that you are adding antennas (the dishes) at each end, which is NOT part of the part 15 spec because the devices, as approved, don't come with dishes, but instead, these flimsy antennas that are more like an HT's "rubber duck" than anything else.

>This technology is inexpensive, reliable, and within the reach
>of amateurs ... like Ed said, it seems a shame that more hams
>aren't using it (or developing something like it ...)

And as I have said, there are problems with that idea, as noted above. It is not "as inexpensive ... [or] within the reach of amateurs ..." as you say.

NOT TRUE!!!

One can pass the Morse test two ways:

1) Answer at least 7 of 10 of the questions correctly
2) Copy (as in "legibly decode") at least 25 consecutive characters correctly.
>
>Does anybody know how many characters are sent total during the five minute
>period of the 5-wpm exam?

Approximately 125.

5 wpm is 25 characters per minute. Times 5 minutes is 125 characters.

Passing grade is 20% - OR do the 10 questions.

In the bad old days, the "one minute solid copy" was the only way to pass in
the USA. 25 for 5 wpm, 65 for 13 wpm, 100 for 20 wpm.

Right on, Bert!

Add the following consideration:

The horse-riding test seems strange because we see so few horses on the roads nowadays. But imagine a society where the number of horses on the road is only slightly less than the number of cars on the road.

On the amateur HF/MF bands, Morse/CW is second only to SSB in popularity.

Very good point, Bert! All this garbage about "the only pass fail element" which requires only a 16.7 % pass rate to succeed, and still they whine like banshees!

Whatta bunch!

Neither does the FCC, after their "power survey" of 12-15 years ago. They concluded that ther was very little difference in the problem created with 1500 watts and 100 watts, not enough to warrant any change in authorized power levels. Nothing changed about the rule that requires hams to use the minimum power sufficient to complete the needed communications, either. Of course they have never defined how hams are to go about determining what poer level is needed, so it might cause some problems should they arbritarily cite an indivivual for that. For instance, they have no way of knowing in advance what recieving equipment is being uses. If hams used crystal sets in esperimental communications, there would be good reason for high power for local communications. Also testing of high power amplifiers might be good reason.

On the other hand, Jim, how many idiot carjackers that steal stick shifts and can't drive them would now succeed? How many Americans in Europe would be cluttering their hiways? When coming down the hill into Bath in England I remember well trying to find second left-handed in a really awful gearbox in an Escort; I am told I did a Goofy 'Ya-hoo-ee' while standing on the brake pedal.

But anyone who is clanking along in second behind a bozo in a Ford Exhibitionist sure as hell agrees.

Because it is being used by land mobile licensees for regional and
national networks with systems other than ACSB.

Contrary to popular legend, it was never "reserved" for UPS, and
in fact UPS rejected the ACSB vaporware system proposed to it in
favor of an 800 MHz FM system using tried-and-true technology from
The Big Em.

What upturn?

Surf over to:

http://www.ah0a.org

and see what the trend in the US ham population has done since 1997.

From September 1998 to March 2001, the numbers have grown. Since March 2001 the
numbers have actually declined.

Details were explained in my reply to Ed.

>In fact, I wouldn't be at all

That was predicted 11 years ago, and it didn't happen. Why should it
happen today?

Dropping the code test from the Tech did not give us a revolution in amateur VHF/UHF. Where are all the "technical professionals"?

Ya missed the point, Carl. Snipped it right out.

On the one hand, I read that there are areas where no repeater pairs are
available. On 2 meters, anyway. On the other hand, I read that the
assigned pairs sit idle 95% of the time.

My question is, if there are so many repeaters on the air already that
are so quiet, why do we need more?
>
>> THAT'S the problem that needs to be addressed.

>> 73 de Jim, N2EY
>
>The problem is that "everyone (group)" wants to have his(its')
>own dedicated repeater pair so that they never have to deal
>with (wait for) other users on a shared frequency ...

Maybe.

Let's say it's true. What of it? Repeaters don't build themselves. A group
puts up money, time, and effort to get a repeater on the air and keep it
operating. Often a repeater is the work of a few dedicated individuals,
supported by a larger group who simply pay the dues. It's natural
for them to want control over their machine and its frequency pair.

> this causes
>repeater pairs to lie idle much of the time, while others could
>be producively using them ...

How does having a dedicated pair cause it to be idle?

The REAL problem, it seems to me, is that there are more repeaters
than hams who want to use them. I count 53 or so pairs from 146 to 148,
plus simplex. If they were all busy, I could see a problem - but they're not.

> the "rub" is when someone else

I know all that. The trouble is that amateur radio is not the
phone company.
>

>and "packet channels" (and all the wars that go with that)
>would disappear, because to the users, the system would
>be transparent and more available. (thus no reason for
>"turf wars")
>
You're missing the point. Again.

It's clear that hams could build repeater systems that are much
more advanced than the current stand-alone, one-freq-in-
one-freq-out systems we have today - IF we wanted to. But
most hams don't want to because they don't see the need, nor the
possibilities.

And there are a few knotty problems to solve:

- Universal standard system (digital voice? trunking? multiple repeaters
linked?)
- How do things like APRS fit in?
- Who decides what repeaters go silent to make room for the new systems?
- Who pays for all the new rigs hams will need to use the new system?
- How are multiple groups coordinated on the same machines?

And lots more. Unlike commercial and military applications, ham radio is all
volunteers and there is little central comtrol or chain of command.

In other words, you gotta sell 'em, not tell 'em.

>I'm sure that if Dick sees this, he will chime in dismissing

Jim,

NONE require it...not one at all. As long ago as 1957, NY state
didn't reuire any "manual gearbox" endorsements to be able to
or otherwise allowed to drive a manual car. For that reason alone I
took the driver's test using an automatic and then, having passed
the test, learned to shift manually on a different car.

:-)

In the last ARRL poll, the margin of support by those that
"voted" was only about 60/40...and that included very few
nocode techs. The ratio has been tilting away from your
"victory" for years. When first proposed, the amateur ommunity was
almost totally opposed to nocode. Time do and time are changin'

AND...in the ennd, it isn't about voting anyway.

Cheers,
Bill K2UNK

Fair enough given the additional detail...but "rescue worker"
wouldn't routinely imply anything having to do with the NYPD.
Question...after 911, do you think anyone would have been challenged
for NOT having such an endorsement IF horses and riders may
have been needed in the initial response? Would someone in the
west be told...no, you can't go "off rode" to try and rescue someone
because we have to wait for a "qualified/licensed" horseman?

Yet even when horses outnumbered cars, there never was a
"horse license" needed. If you wanted to ride a horse, you
didn't need anyone's certification to just go do it.

> On the amateur HF/MF bands, Morse/CW is second only to SSB in popularity.

So? If someone is "fumbling along" at 2/3 wpm, what's the problem?

Dick,

Every organization I have been in simply declares people "elected" when
there
is no one in opposition. Are you in ARRL? They do the same thing.

Cheers,
Bill K2UNK

Sound more like American. In Burlington, CT, there have been a few elected positions for which only the Republicans offered a candidate. They were elected on that basis.

Sounds like you are fishing to try to find ways to make NCI look bad, Dick. If all you can find is that NCI membership saw no reason to contest any of the seats for the NCI Board of Directors, that speaks pretty highly of the organization, IMHO. In your zeal to be an NCI basher, you are unintentionally ending up being one of their strongest advocates. :-)

>The problem is that "everyone (group)" wants to have his(its')
>own dedicated repeater pair so that they never have to deal
>with (wait for) other users on a shared frequency ...

Given the useage of amateur frequencies on most bands, such waiting is not at all likely. One would only have to wait if all available frequencies were in use.

>In fact, in such a system, voice and data use could be
>integrated, promoting much higher usage of channels,
>while maintianing a level of service that would keep
>folks happy ... even though the traffic loading would be
>MUCH higher than the "dedicated repeater pair" system
>could ever handle.

And, there is nothing that says that an entire Amateur band has to be so allocated. I believe that most of the "random access" parts of the band, ie weak-signal and satellite can and should be preserved as is. Things like spread spectrum could probably be overlayed on this scheme relatively easily, possibly by including FHSS systems in the dynamic allocation.

The real rub is that there IS a need for such a system, even in the relatively little used system of Amateur repeaters. Yes, there are ways that the coordination process should be improved so that little used pairs could be more easily deallocated to those who would really like to use them, but a system that dynamically allocated frequencies in the Amateur bands would allow everyone equal access to the bands in such a way that 99% of the time, everyone who wanted to use the band could be accomodated.

Yes, there ARE existing architectures that need to be considered and there would be pain in the changeover, but real-world radio goes through this, at much greater pain, when it has to. What is really ironic is that when such a need arises, industry competitors are able to create committees and find solutions, because they fully understand that having common standards is better than not having them, and that it often goes past merely benefitting everyone -- in many cases, having those common standards is a matter of survival.

>the ONLY reason that they cited for keeping any Morse
>testing at that time was the existence of the treaty obligation
>under S25.5 of the ITU Radio Regulations.

And do keep in mind that when a requirement to demonstrate knowledge of Morse code is removed from S25, that alone will not change the rules in each nation. A rulemaking process will have to occur in each country. To my knowledge, no nation has a "sunset" clause in its present rules.

It will be interesting to see what is put on the plate and by whom, and what the ARRL's position will be when the time comes. If I had my druthers, ARRL would make an NPRM that removed most code testing, but preseved a 5 wpm test for access to the lower 25 kHz of some HF bands and included some questions in the written on the content of sent Morse code. Given the "all or nothing" outlook of some members (in both directions!), however, I think it unlikely that the League will do that. My guess is that they will not file anything, but will offer comments on the NPRM proposed by the FCC or other organizations.

From: "D. Stussy" kd6lvw@bde-arc.ampr.org

>However, also remember the range of your wireless LAN - it's
>measured in feet, not miles.

Ah, if only it were so. An SS Part 15 device on 2.4 GHz is permitted 1 W peak power and 6 dBi antenna gain. For each 3 dB of antenna gain over that, the power needs to be reduced by 1 dB. So, 100 milliwatts and 36 dBi gain would be about the top end of the practicality limit. This is an EIRP of about 400 watts. Feet?

Some of the hobbyist users of wireless LANs have been achieving tens of miles easily.

Hams, btw, can use these Part 15 devices quite legally in the ham bands, as is, by merely selecting one of the available channels whose modulation products fall entirely within the ham bands. Without automatic power control, we can run up to 1 watt and unlimited antena gain, so we could relatively easily achieve 4kW EIRP and do some serious work.

Amateur use of 2.4 GHz would be unconditionally protected from harmful interfernece from the SS operation, but Part 15 operation would not.

Carl, as I am sure you are still hanging on, in what way does the IEEE 802.11b protocol handle the encoding of the network name? If I name my local network W1RFI, I am wondering whether that is transmitted in such a way that it meets the FCC identification requirements? You are our resident IEEE 802.11 expert, so please fill us in.

It was discussed in QST, on the ARRL web page, in the ARRL Letter, in various ways through TAPR, made public through an FCC Notice of Proposed Rulemaking...

What else should have been done?

>But we are NOT permitted to avail ourselves to the equipment itself because
>it
>GOES OUT OF BAND (see the paragraph you quoted below).

>Therefore, we can't recognize the advantage of using this stuff with
>higher power, etc..., without substantial modification ...

Although the Part 15 allocation extends above the ham band, the Part 15 IEEE 802.11b devices I have used as W1RFI can be easily operated entirely within the ham bands simply by selecting the appropriate operating channel.

Why are you saying that these devices require extensive modification to use?

>And as I have said, there are problems with that idea, as noted above. It is
>not "as inexpensive ... [or] within the reach of amateurs ..." as you say.

I paid $200.00 for a pair of IEEE 802.11b cards. I found that selecting channel 1 made it very much within my reach to use as a ham.

I am not sure that there are enough non-ARRL NCI members to hold sway on that one.

It would be interesting to see NCI support a slate of Directors in some of the upcoming elections, though. :-)

I don't know the positions of most of the ARRL Board on code testing. Has NCI ever had some of its members contact their ARRL Division Director and ask him what his policy position actually is? That position could be made public, although it would be the ethical thing to tell the Director what use would be made of his position statement. :-)

>antenna gain is measurable,
>of course, but with more difficulty.

On HF, I believe the "more difficulty" is enough to make it virtually impossible. Unlike AM BC antennas, where the fields at ground level are also the maximum fields, most HF antennas used by amateurs put more energy skyward that one would measure on the ground.

Considering that what one measures at low height (meaning any level below the antenna) is very much influenced by the characteristics of the ground and nearby scatterers, I don't think you can easily get correlation between a field measurement and the far-field at a particular angle skyward.

I see no compelling reason to change the existing rules on absolute maximum power levels. What reasons could be given to the FCC?

OK now let me ask you this. If you call CQ with 1500 watts and everyone that
hears your call has only 100 watts to answer you with, when they try to answer
you don't hear them. Did the 1500 watts do YOU any good, since you could
not establish contact "both ways"? BTW this isn't a flame just an honest question.

2267. A brief history of "Stagger Lee" vs KC8JBO

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-20 15:43:14 UTC
From: Stagger Lee <SLee@houston-hunks.com>
Message-ID: <3C4AE592.6A0CDA7E@houston-hunks.com>
Source record: 31740
Cross-posted to: alt.radio.scanner.flame_fest,alt.cocksucker.roger-wiseman,rec.radio.amateur.misc,rec.radio.amateur.policy

Y'know Wiseman, I normally don't give you serious material, because I know damned well that you don't really read what other people write, anyway. You are too busy "thinking" about what you are going to spew next.

But our one year anniversary on Usenet is fast approaching, and I want to let other people know how "Stagger Lee" got involved in the first place. So skip the rest of this post, Wiseman; it isn't addressed to you.

What got to me was the way that Wiseman treated women. He wasn't in a "flame" group, and one poor woman had no reason to expect the following vomit to issue from Wiseman's keyboard in message <985226467.3ab95ce327403@webmail.cotse.com> (I have only reposted the first couple of paragraphs):

====

At that time, COTSE was free and was one of his Usenet providers. COTSE also automatically inserted the X-No-Archive header so that its subscribers could hide from a Deja News search. This post is only available because Brenda Ann quoted it in her reply.

In another archived post, we find the following example of Wiseman's vileness:

====
> From: KC8JBO <kc8jbo@MailAndNews.com>

====

These were far from the only two instances of Wiseman engaging in vile and harassing posts in newsgroups where such posts are not expected or welcome. He had been driven from the so-called "flame" newsgroups -- places where such posts *are* expected -- and so he came looking for victims in the radio news groups. Such posts violate the terms of service of the vast majority of Usenet providers, although the owner of COTSE seemed to have the laughable notion that what Wiseman was doing was exercising freedom of speech. Slander is of course not protected speech in the US, but the concept that even free speech has its limits seemed to be impossible for Steve Gielda -- COTSE's owner -- to grasp.

I indeed complained publicly in one of the newsgroups that the owner of COTSE regularly read, and saw to it that Wiseman's vile posts showed up in that news group too. When Gielda and his supporters complained, I suggested that they take their own advice and use filters.

When the shoe is on the other foot, it often pinches.

Eventually, Gielda started charging for COTSE access and Wiseman of course quit using COTSE. At that point, his posts began to moderate just a little, because he knew that he could lose his Usenet accounts with the other providers if he continued. When his confidence returned and he resumed his harassment, I saw to it that the alt.flame regulars knew about his posts.

The rest is history.

Wiseman now has his own news group (alt.cocksucker.roger-wiseman), two "special" web pages, and a whole series of awards for 2001, all provided by the people of the flame news groups. He has been revealed as a fool,

and is now a laughing stock of Usenet.

Soy Yer Nora, Woger Dimwit. You are getting almost everything you deserve.

[Any followups by Wiseman will be ignored.]

perhaps someone who can't break through on or who had been chastised for continually using his last 2. You'd think with all the engineered skills and equipment he should have he's have the most efficient antenna system this side of the WVa Big Dish

Perhaps he needs an amp (what do you think Bill?)

CS reminds me of the people who complain that a particular operation was one of the worst ever only to discover he never worked them.

Ever heard of a CW rig from the Altoids(TM) tins? There's a fella,
K4IWL/Len, who makes them. I haven't seen him lately to ask him, but they
now have these even tinier Altoids tins that I wonder if anyone will try to
build a rig into...

If I were to conduct myself within my interpretation of the FCC R&R, let's say on 10M, from my fixed station, with a station I've heard in Japan, I would use half the power output capability I have to attempt a contact--that would be 50W. If the person was in NY, AZ, etc., I would probably try no more than 25W. This would be on a vertical, as that's all we've got right now. If I don't make contact, I keep going up, say 1/4 more of my rig's capability, until I am at full power output, which is 100W (I think--it's a Yaesu 890FT/AT). If I don't make contact then, I just drop it.

Now, mobile, with my 25W rig, I'd just start with all it's capable of, assuming that a mobile rig can't be relied upon to make contact with less than 25W. To me, that is "wrong" to do, but I would do it. The reason I think it's wrong is I think to truly follow the spirit of the R&R, I should attempt with only 1/2 of the rig's output level.

In both cases, I would drop power levels back--checking RST with my contact--until we could not maintain our desired contact duration.

On 2M/70cm I am really, really bad. Unless I am operating simplex (my preferred communication mode), I never play with my power setting for just everyday communicating. Most of the repeaters I am going through are quite some distance from where I am usually driving (however, I don't even change power level when I am right underneath the repeater antenna), so I don't minimize power, I leave it at the rig's "High" power setting. Now, for some reason, I do like to cut power back to Medium when I am on simplex, and Low if I am right near who I am talking to. I think I got in the habit of doing that because I figure that simplex changes the parameters of operation to

where a whole bunch more could be on frequency, not interfering with each other, if power levels are regarded and experimented with. Of course, squelch settings also come into play on simplex. I don't know how many times I've advised cantankerous operators to turn back their squelch setting if they can hear me on simplex in Arlington (more than 25 miles away)! :)

I have never encountered any such "mentatlity" among
serious amateurs, but it is beside the point anyhow,
since your receiver can't distinguish from interference
("ERP") caused by antenna design, amplifier design, or
mother natures design of the existing propagation.

> Output power *could* be "enforced" by making it
> a prima facia violation to possess a transmitter

Then possession of an automobile capable of moving
faster than the speed limit would also be illegal,
or possession of more than the amount of alchohol
needed to raise your blood level above .08% would
be a violation, or having more bait than needed to
catch your legal limit of walleyes would be a crime?

Go join Robeson in the "control freak" newgroup.

With all kind wishes,

de Hans, K0HB

In many (all?) locales, there is still a November
election because people can "write-in" at the
last minute. It rarely works. Organizations, however,
usually (at least all I have ever
seen) simply declare nominations closed and
the lone nominees are declared elected.
For organizations, that saves much $$$,
time, etc.

I don't know as I would go that far. Carl was not pushing to see the power limits changed, just made an off-the-cuff comment that he see his way clear to support such a change. I see no such need, nor do I believe a compelling case could be made to the Commission.

Under the circumstances, no, it didn't do me any good. Those circumstances are only somewhat likely. IMHO. If you are running 1500 watts, in most cases you will hear the 100 watt station. He/she will be lousy copy, but you will hear them. I have found an interesting phenomenon in most contests -- many of the participants only answer CQs if they are loud.

So you admit you are a drug addict?

> That is true, woger

Nice of you to admit it, repeater jammer.

>doesn't know who is father was.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

"Who is father was?" Learn to spell, repeater jammer. We all know you don't
know who your father is.

I don't believe that spread-spectrum and weak-signal are compatible. Weak signal cannot toleratea rise in the noise floor (such as caused by SS) very well, so I understand from those who do weak signal. Satellite, due to its nature, approaches weak signal's intolerance for a noise floor increase.

Or is that all propaganda by the weak signal people?

Ah, but since when does the user have frequency control of a SS device? You
must be making some sort of assumption I am not.

>Amateur use of 2.4 GHz would be unconditionally protected from harmful
>interfernece from the SS operation, but Part 15 operation would not.

Right, but as I mentioned when we talked face-to-face at the ARRL SWD
convention for 2001 in Riverside, CA, "protection" from part 15 is a JOKE on
2.4GHz, considering all the "bad" part 15 devices that already exist....

That gets to my other problem. Manufacturers of this hardware don't provide
the necessary information (i.e. trade secret) for us to be able to readily
modify this equipment. We clearly have two requirements:
- To stay below 2450MHz, and
- To identify (in mode)(*)

(*) - Due to its frequency hopping, I don't believe that ID'ing in morse code
would be practical (or valid) unless the code is slow enough that every "dot"

happens to have part of itself land on every used frequency in the hop pattern. Id'ing in mode would have to occur. However, as an unrelated problem, how would another amateur be able to tell the difference (from remote - just by the signal) between a modified system as amateur vs. part 15 (its original origins)? Not everyone has a spectrum analyzer, etc....

I agree, for the most part, although there are times when an SS signal can exist in a block of spectrum and not be audible at all to those that are using that spectrum for narrowband modes. A system to dynamically allocate narrowband users in a block of spectrum would be easier to manage, IMHO.

>Or is that all propaganda by the weak signal people?

Why would they want to make something up? I agree with the general idea that SS and weak-signal modes are not compatible, and, depending on how the SS is set up, either can be the loser.

Ed:

Interesting. In my own personal experience, I would tend to think that using 1500 watts when first calling CQ, or at any other time, is virtually NEVER warranted. Unless, of course, one was using an inherently inefficient mode such as SSB…then you may need it! I have used nothing but CW and a handful of digital modes in the last 9 years of HF operation -- made a couple of thousand QSO's covering the globe, using a maximum of 25 watts of power and indoor dipoles for 20 thru 10 meters. If the maximum power output levels for amateur HF were ever reduced to the levels being discussed, my question wouldn't be how could I go down to those levels, but when would I ever come UP to those levels? I may never get there at all!

No. Optional equipment can be approved separately for use with the
transceiver and this is done quite often. This allows third parties to
produce the optional equipment, which I guess is good for competition.
For example, see http://www.hyperlinktech.com

I used 24 dBi antennas and pole-top external amplifiers (to compensate
for the coax losses) to support an 802.11 link over 4 miles at my old
house. This worked fine, in fact it was overkill since it continued to
work even after the power supply for one of the amplifiers fried itself.

>Ah, but since when does the user have frequency control of a SS device? You
>must be making some sort of assumption I am not.

He's talking about IEEE 802.11b devices. For the U.S. the standard divides
the band into 11 overlapping channels at 5 MHz spacing, each about 20 MHz
wide, and you pretty much always get to pick which channel to use. Channels
1 (center at 2412) through 6 (center at 2437) will keep it within the amateur
band. Note also that 802.11b is DSSS, and at 11 Mbps in a 22 MHz channel
isn't getting much coding gain either. Since it copes with noise by
falling back in speed to increase the coding gain, using this stuff to
best advantage in the presence of other 2.4 GHz devices requires picking

frequencies carefully. For my house I ended up on channel 6, at the middle
of the band, since going much higher or lower caused grief to my Siemens
cordless phones. This, of course, maximizes my exposure to interference
from the microwave oven, but this only causes trouble within about 10'
of the oven.

Unfortunately 802.11 FHSS equipment, which is lower speed but more
robust, will by default hop across the entire band. It may be possible
to reduce this at the programming interface to the chip (the hardware
must support reduced bandwidth hopping sequences if it is to be sold
in countries where the 2.4 GHz band isn't as wide as in the U.S., the
only question is whether it can be told to do this at lower frequencies),
so to use these you'd need to know something about the hardware.

>>Amateur use of 2.4 GHz would be unconditionally protected from harmful
>>interfernece from the SS operation, but Part 15 operation would not.
>
>Right, but as I mentioned when we talked face-to-face at the ARRL SWD
>convention for 2001 in Riverside, CA, "protection" from part 15 is a JOKE on
>2.4GHz, considering all the "bad" part 15 devices that already exist....

I don't get it. 2.4 GHz is a shared band and will never be quiet,
but the Part 15 devices themselves seem to cope within their constraints
and that includes links that extend for miles. It may be you need to
use modulation and coding as robust as the Part 15 devices do, and it
may be that it is way too noisy to support a 60 mile link at 1/4 Watt,
but as an amateur you aren't limited to 1/4 Watt either. It reduces
to an engineering problem.

>>Carl, as I am sure you are still hanging on, in what way does the IEEE 802.11b

>modify this equipment. We clearly have two requirements:
> - To stay below 2450MHz, and
> - To identify (in mode)(*)

I agree that modifying the hardware itself is a problem (in high volume
hardware it is usually a couple of ASICs anyway, so even with full
documentation you won't be doing much with them they weren't designed
to to in the first place), but that doesn't mean they aren't useful as
a system component. What comes out of the RF connector on these devices
is well and fully defined by the standard, for example, and for many
the programming interface is documented, if not by the manufacturer, then
at least by the Linux device driver someone wrote.

In this case the standard says that DSSS cards can definitely be made
to keep below 2450, though FHSS cards are a problem unless the hopping

sequence is exposed at the programming interface somehow. For ID I'd be inclined to encode the call sign into a locally-administered-format MAC address and make the card use that instead of the vendor MAC address (I don't know whether Windows will let you configure this, but other operating systems do) since (we know from the standard) the local MAC address is included in every transmission the card makes.

Note that if you still don't like 2.4 GHz you could always use the card output as an IF and shift it up into a band where there is more space. There is plenty of room at 10 GHz for the full U.S. 802.11 FHSS hopping sequence, for example. Even if the card itself can't be modified doesn't mean it can't be used as is as part of a bigger system.

Don't hold yer breath.

>Given the "all or nothing"
>outlook of some members (in both directions!), however, I think it unlikely
>that the League will do that. My guess is that they will not file anything,
>but
>will offer comments on the NPRM proposed by the FCC or other organizations.
>
Maybe. But my guess is there won't even be an NPRM at all. Was there an NPRM for code waivers? How about when the sending test was waived?

Prediction: FCC will simply "waive" Element 1 if S25.5 disappears. They will issue a short announcement that they are following up on their R&O to 98-143 that said
code testing "serves no regulatory purpose". Proposals and petitions will be after
the fact. Any NPRM (if one even happens) will simply be about rewording the applicable regs.

The thing to be doing now is discussing what the new ARS license structure should be without S25.5.

There at least 100 different ways of getting those 25 characters, too. The "7
of 10 questions" did not exist back then.

We also had to send in the old days. I had to do 13 and 20 wpm on a straight
key
to the FCC examiner's satisfaction. I can still do it easily.

Been there....

--

New level of surrealism reached:

PBS in these parts shows "best of" the Ed Sullivan Show in various time slots.
Shirley Jones (yes, THAT Shirley Jones) is the host/introducer.

Most shows consist of a few classic acts (early Joan Rivers, young Elvis, and of
course a very nervous Fab Four) filled out with a stupefying array of
plate-spinners, vaguely foreign acrobats and novelty acts.

Last night they did a special that was held in some big outdoor arena in 1970. It
was a tribute to Rodgers and Hammerstein, with various folks portraying scenes
from classic musicals. But they were not the folks who made the musicals
famous. Went from the sublime to the surreal:

Shirley Jones and Herschel Bernardi doing the roles of Deborah Kerr and Yul
Brynner in "King and I"

John Davidson and Jeannie C. Riley in "Oklahoma"

The Lennon Sisters and others doing "My Favorite Things" from "Sound of
Music". The role of Maria (made famous by Julie Andrews) was done by
- Mama Cass.

I am not making any of this up.

I don't know why someone would want to put up a repeater if all the pairs are gone but most of them "sit idle 95% of the time".

>Although it is not certain that activity would go up if more repeaters were
>allowed, but I feel that it would.

I think the opposite would happen.

If many of the repeaters "sit idle 95% of the time", as has been claimed, how would having more of them increase activity?

>Probably without even being asked.

I have been told by "an authorative source" that a ceratain organization will have its petition for rulemaking in to the Commission before it can even think about doing one of its own. :-)

I agree, Jim, that it is virtually certain that S25.5 will be dropped at a future WARC. Whether it is the next one depends mostly on whether they feel they have enough time to consider it. My guess is that it will take only a short time to reach concensus on what should be done. It is also virtually certain that the Commission will follow suite.

None of that will change the benefits and advantages to using Morse code in ham radio. Some of the things being said today to "defend" the mode will hurt the cause when Morse testing in its present form is no longer mandated.

>The thing to be doing now is discussing what the new ARS license structure
>should be without S25.5.

And discussing the benefits to learning and using Morse code without testing.

We could put this to the test. You could call CQ on 40 meters with 100 watts and I could call CQ on 40 meters with 1500 watts and we can see who gets an answer first. We could also try it in the November SS and see who works the most stations in a 1 hour period. That should answer the question nicely.

>Only if the part 15 device received its acceptance with the external
>equipment as an option. It's my understanding that this isn't
>regularly done.....

It is done a lot. There are provisions in Part 15 for equipment that is usually installed by "trained installers." IMHO, this was a major faux pas by the FCC, but many of the wireless LAN devices have antenna connectors.

>>Hams, btw, can use these Part 15 devices quite legally in the ham bands, as
>is,
>>by merely selecting one of the available channels whose modulation products
>>fall entirely within the ham bands.
>Ah, but since when does the user have frequency control of a SS device? You
>must be making some sort of assumption I am not.

Yes, I am making the assumption that when a user uses the software to select a channel for the IEEE 802.11b device, the device actually goes to the frequencies that the owners manual says it will. Why would you assume otherwise?

>Right, but as I mentioned when we talked face-to-face at the ARRL SWD
>convention for 2001 in Riverside, CA, "protection" from part 15 is a JOKE on
>2.4GHz, considering all the "bad" part 15 devices that already exist....

I agree, although I am not sure what you mean by "bad" Part 15 devices? However, where are the reports of harmful interference? I will gladly help take ANY documented case to the Commission. Right now, every time a rulemaking procedure comes up, the Part 15 industry and the Commission both point to the part of the rule that says "no harmful interference." They they state that the present rules must be working because the Commission doesn't have many reports of interference to ham radio from Part 15 devices. In those cases that they ARE aware of, for the most part, the involved parties did the right thing. (http://www.arrl.org/tis/info/rfiteljx.html).

I can live with the present rules IF the Commission will enforce actual cases. So far, they have been good about power lines stuff and they did go to bat for Amateur radio with the Darwin Networks 2.4 GHz interference case, but we really don't have enough to go on. Where are the reports?

>That gets to my other problem. Manufacturers of this hardware don't provide
>the necessary information (i.e. trade secret) for us to be able to readily
>modify this equipment. We clearly have two requirements:
> - To stay below 2450MHz, and

>would be practical (or valid) unless the code is slow enough that every "dot"
>happens to have part of itself land on every used frequency in the hop
>pattern. Id'ing in mode would have to occur.

Typing "DE WIRFI" every 10 minutes would do it. The computer could do it for
you.

> However, as an unrelated problem, how
would another amateur be able to tell the
> difference (from remote - just by the signal) between a modified system as
>amateur vs. part 15 (its original origins)?
One could not tell, even with a spectrum analyzer. One would have to look at
the content. This is true for every one of the many digital modes available to
Amateur Radio. In one sense, it is moot, because under the rules, if an Amateur
SS signal causes harmful interference to a non SS operation, the SS operator is
responsible for addressing the harmful interference.

73,
Ed Hare, W1RFI

Not everyone has a spectrum analyzer, etc....

The same is true of many modes. Like PSK31.

>That being the case, in an emergency ONLY
>the ham can be the operator.

Yup.

>Most other modes allow for
>anyone to be the operator and the ham can "be there"
>as control operator.

Which means you still need the amateur at bot ends anyway.

>That allows the ham to let emergency
>people directly communicate with each other even though they
>no knowthing about the ham radio, etc. There is a beutiful
>simplicity too in just being able to use the mike button/push
>to talk.

Sure - if that's what the situation requires.

>Balance one againt the other? The world has
>already done that by default.

Not really. In many situations the PTT voice thing is what's needed. But that
requires both emergency folks to be where the radios are.

There are situations where a text report is needed. Still others where "one
picture
is worth a thousand words". All depends on the situation and the emergency.

There is also the fact that common voice modes can be intercepted by anybody
with a receiver.

It takes the lowest class, the Codeless Technician. It takes 27 of 35
questions from a Volunteer Examiner session and I believe $10 and the
ability (photo id) to prove you are who you say you are.

Info sources:

http://www.arrl.org where the whole question pool is available and
affiliated clubs who would be giving the exam.
http://www.qrz.com which has some good sample exams.

If you can put up with the anal AMA types you can put up with anything.
Just be sure to get the flags right and never never use the &#65533; on your
plane if you live in the Great Midcontinent and get one on your callsign.
Note that there are special - no big deal- rules for model control under
Part 97 the Amateur rules that you should be aware of.

Hey Stagger Lee and Arf arf!, there's hope for you two to save your
marriages yet, and you can afford to cash in $40 worth of your food stamps.

I answered 10 of 10 for all 3 code tests *and* did solid copy, just to make sure. I never really worked out the math, but 20% to pass? Wow, that's just too easy. I'd like to go back to college and retake all my tests on that scale. After some of those "long" weekends, the 20% pass thingy would have helped. : -))

As I read part 97, it allows for the operation of *any* equipment by
anyone where the purpose is to save a life. No "horse endorsement"
required.

I'd agree if the punctuation characters (& the prosigns?) didn't count
for two. Also, nothing cryptic is sent. (i.e. random runs) This is
part of the reason I was interested in 'Conversational CW 101.' If I
see "U_ R_T IS 89_. QT_ I_ PHOENI_, A_. M_ NA_E I_ MARTI_." I just
sent 46 characters without so much as one prosign. They give you an
"official" minute or two (More like five to ten, if you really need
it.) to "fill in the blanks." (_ represents missed characters) Out of
the 11 missed characters, I'd have to say all 11 are gimme's. The next
thing you'll hear from the VE is "are you taking any other exams
today?"

Ed, I certainly don't want to sound like a curmudgeon or give anybody
a hard time. I just don't feel that the COMPLETE elimination of
element 1 is in the best interest of AR. From the looks of it, many
others feel likewise. I'd be very surprised if anybody who put a
little sustained effort into learning 5-wpm CW didn't break out into a
big "$hit-eating grin" after the first few characters of the exam are
sent. As you know, I was the poster-child of a "nervous Nellie" before
the exam. (As you should well remember. :-D) With 20/20 hindsight, I'm
now of the opinion that if half of the effort expended on the removal
of the code was put toward studying or assisting others in studying, I
don't believe there'd be any issue.

> Must be that new math, but I didn't think Dick would fall for it. :-)

LOL! Not really, but there's a better analogy. When pocket calculators became so commonplace and affordable, was there a move to eliminate mathematics by hand/brain? Hence PSK31 will not "replace" CW.

> 73,
> Ed Hare, W1RFI

> you don't hear them.

That's true in rare cases. In general what each station hears depends
on things
like antennas which are far more variable than power level.

> Did the 1500 watts do YOU any good, since you could
> not establish contact "both ways"? BTW this isn't a flame just an honest question.

If no contact was established, the power didn't do any good. But such
cases
are rare.

Consider the case of the multi-multi DXpedition running 100 watts to
verticals
being called by US hams. When conditions are "good", the
QRP-and-attic-dipole
folks work the rare one. When conditions are not so hot, the
1500W-and-beam folks work the rare one. Everybody wins.

Remember, the DXpedition's time is very precious - the stateside ham's
is not so precious.

"W5TIT - Kim"

> In earlier times, there was certainly a lot more to being a ham.

Boy, do you ever have that bass-ackwards!

There is so much more "to being a ham" today than there
was in the "earlier times" that a "Rip Van Winkle" of just 50
years ago (end of WW-II) wouldn't even recognize the things
available to them today as "ham radio".

Those folks used Morse code, AM phone, 60WPM RTTY,
a few guys were playing with SSB, and a couple with
those newfangled transistor thingies.

Space communications, APRS, LEO's, AX25, PSK-31,
DX-spotting clusters, computerized logging, credit-card
sized transceivers, "xxxTOR-du-jour", DSP, etc., would border
on "magic" to the hams of that era.

> It was still a hobby, but those who engaged certainly were
> among the elite.

Elite? You've gotta be kidding. In that era ham radio was
the domain of high school kids, young experimenters, and
blue-collar workingmen. It was a "get your hands dirty" sort
of hobby, available to anyone, not some sort of "elite" thing
at all. Respectable HF stations didn't cost thousands of
dollars, but were often put together with the proceeds from
a paper route and a little scrounging from your uncle Elmers
junk box. "Elite" indeed!!!!!!!!!!

With all kind wishes,

de Hans, K0HB

Dick obviously subscribes to the rule of "first cause", i.e. everything has to have a cause. Therefore, God caused the universe. But one either believes in "first cause" or one doesn't. If one believes in "first cause" then one is required to answer the question, "Who or what caused God?" So believers of "first cause" are predestined to be trapped in an endless illogical loop of causes none of which can be the "first cause" because every cause must have a cause including the "first cause".

If God doesn't have to have a cause then neither does the universe have to have a cause. Time itself apparently is discontinuous and/or nonexistent at the moment of the Big Bang. Consider that there was no need for the concepts of time and God before man appeared on this earth.

Kim, if you wouldn't mind, please send me your email address.

If Squiggy's lunacy goes on long and far enough who knows the results? If you don't believe he's a crack pot, consider how many usenet posters use PGPon each and every post. I know of none other than him who use it or anything like it at all. Paranoia personified,. but what would you expect of one who has always considered as mere code test where has NEVER been required to get correct more than 20% of the characters, to be a horrid "hazing ritual", and has done so for near 30 years? His rangting on the subject is legendary, and nolt for the weak of stomach. The man's mental stability is seriously in question, and I'm sure any mental health professional would so note.

They are not called names because they "passed the test". Many
NCTA extras "passed the test" and are not called names (except
by the PCTA folk).

COOL!

> I never really worked out the math, but 20% to pass?

One solid minute out of five.

> Wow, that's
> just too easy. I'd like to go back to college and retake all my tests on
> that scale. After some of those "long" weekends, the 20% pass thingy would
> have helped. : -))

In the bad old days the ONLY way to pass was to produce at least one
solid minute of legible copy. And you were NOT given any time to go
back and
fill in holes or correct mistakes - when the code stopped, it was
pencils
down or you failed. Minimum 30 days wait to retest, too. No CSCEs or
partial credit. Two years' experience as a ham before they'd even let
you
try the Extra.

I failed 13 per the first time because the examiner could not read my
writing. Went home, taught myself to blockprint at 30+ wpm, came back
after the 30 days and passed easily. Did the Advanced written, too.
Not
bad for an 8th grader back in 1968.

Two years later I'm back for the Extra. Turns out I'm the only one
there
for 20 wpm so it's just me and the examiner. Test starts, I write down
the
code in big block letters, examiner watches me like a hawk. Comes

around
behind and peers over my shoulder. Looks at the paper-tape code
machine
and shuts it off about 2 minutes into the test.

"Pretty easy, huh, kid?" he sez.

"Umm, yeah" I sez.

"It oughta be - that was 13. Here's 20" and he changes speed spindles
and restarts the machine.

I'll never know if he just forgot to change the speed or if he was
testing to see if I could handle 13 wpm before letting me try 20. In
any event I did the required 100+ characters at 20 wpm and showed him
I could make the J-38 do the job, too.

Well, well.... Look who "fell" for it! A test of 125 characters in which the applicant must recognize 25 consecutive is not the same as a test where only 25 must be recognized from the total. Sure, that is correct. But it's nowhere near the same test as just answering a fixed number of questions. If one is truly capable he can copy the first 25 characters and then lay his pencil down. If he is not, he can call the whole thing a "hazing ritual" and join NCI.

So, you're telling me that this stuff ISN'T SPREAD SPECTRUM across the entire band (2400-2483.5)?.... That's not evident to anyone who isn't a manufacturer, especially considering the original spec. (indicated below).

>Unfortunately 802.11 FHSS equipment, which is lower speed but more

>to an engineering problem.

I get 2.4 cordless phone interference on my 2.4 GHz input to my repeater all the time. ANY signal there is sufficient to block an amateur signal farther away (weaker field strength). Some of these phones come in from up to 5 miles away (at least by computed signal strength), and don't SS-hop. The fact that there is no quiet portion of the band means that it is USELESS for repeater linking and such (its traditional use) and has a high potential for interference with ATV.

Note: Don't talk to me about PL or other such nonsense. That only keeps the repeater from repeating the interfering signal, but won't help at all with regard to the repeater NOT hearing the amateur station because of someone's phone blocking it. Not only that, the CHEAP phones will pass audio down to about 30-40 Hz. I noted that when someone's voice on one of these phones managed to open the CTCSS filter for a couple of seconds because that voice had a frequency component that happened to be the selected PL tone.

Now, for a 2.4GHz repeater OUTPUT, our allowable higher power and use of CTCSS by the receiving amateur station(s) will make the cordless phone and SS devices irrelevant.

If the box says that the frequency range is: 2400-2483.5, I do NOT assume that the device can be limited to a subset of that range unless it also says that it can be. When was the last time you saw a box that said "a user selected 20MHz wide channel in the range of 2400-2483.5"?

>(http://www.arrl.org/tis/info/rfiteljx.html).

In my case, and with talking with my local coordinator (SCRRBA), we decided
that interference complaints on this are best filed after a FINAL COORDINATION
for the 2.4 GHz operations of the repeater has gone through. In that respect,
I still have to build the transmitter half. They are aware of my
experimentation at present.

As we discussed, ANY signal on an input-only frequency may interfere. However,
to properly make a complaint, we must have ACTUAL interference, not just
potential interference. Since no one other than me has used the input (and I
have always managed to capture the input since operating from my base station),
I don't yet have anything to affirmatively report. I haven't been able to set
up a mobile transmitter yet, but that will probably be what will generate any
complaint that I'm able to muster....

Yup, that is what he is telling you. The channels are 20 MHz wide.

>>so to use these you'd need to know something about the hardware.

>That's my point. The manufacturers won't tell.

Actually, in many cases, the hardware is a masked, programmed chip, so there is
little to tell.

>I get 2.4 cordless phone interference on my 2.4 GHz input to my repeater all
>the time.

Do me a big favor -- document this interference and get a report to me at ARL
HQ. I am very much interested in these sorts of reports. If you have any
information on the offending party(ies), please include it. If it would be
helpful, I am willing to write a letter to the operater of the phone. We are
batting about 40% so far with such letters to neighbors. A few are about to get
a letter from the Commission.

> Now, for a 2.4GHz repeater OUTPUT, our allowable higher power and use of
> CTCSS by the receiving amateur station(s) will make the cordless phone
> and SS devices irrelevant.

A very strong Amateur signal could make the Part 15 operator just as unhappy as
you are. :-) And they are offered NO protection against interference from
Amateurs. The best "defense" of our bands would be to use them heavily.

>say on 10M, from my fixed station, with a station I've heard in Japan, I
>would use half the power output capability I have to attempt a contact--that
>would be 50W.

Actually, I would wager that the FCC would be quite content to let Amateurs
either use or not use their linear amplifiers, as necessary. I don't think
that anyone expects amateurs to adjust power on the fly in 3 dB increments.

>If the person was in NY, AZ, etc., I would probably try no

>the USA. 25 for 5 wpm, 65 for 13 wpm, 100 for 20 wpm.

Jim:

What was so bad about that? The second time I took my 20 WPM code test (my CSCE had expired by a few days -- I passed 20 when going for my General the previous year) I had almost 5 minutes of solid copy, and passed all the questions on the fill-in-the-blank test. Not a problem -- and a mere two years earlier, I was dragging my knuckles with the best of them, whining about having to learn the old fashioned Morris Kode in order to get a ham radio license! How dumb was that?

True on both counts - but both activities support the basis and purpose of the
ARS.
>
>An MD is not in *any* avocation, as related to his education. An MD is in
>the *business* of diagnosing, preventetive medicine, and treatment--on
>*HUMAN BEINGS* for the sake of this discussion (not counting those who are
>veterinarians, etc.)

But except in the case of freely made contractual obligations there is
absolutely
no requirement that an MD, DO or other medical professional provide medial
services.

And there are plenty of MDs and other medical professionals who volunteer their services for little or no pay. Lawyers do pro-bono work. I know engineers who have provided services for free to support a good cause.

>Most people who take formal education are taking that education to then
>apply what they have learned to some area of professional life.

So? Plenty of people take formal education and then don't use it in professional life.
>
>The ARS should *not* be in the business of being so discretionary when
>judging how important one is by how they got their license or what they do
>with it once they get it.

I'm not sure what you mean by this.

Are you saying that nobody should have any opinion about what other hams do?

>Just as we, as people, should not be in the
>business of saying that someone who joined the Boy Scouts but never became
>an Eagle Scout is some kind of moron for not having done so.

I don't see the connection. btw, the requirements for Eagle Scout make amateur radio exams look like a piece of cake.

>Or, that a
>gardener who has never introduced a new rose because they've never
>experimented with grafting isn't a *real* gardener. Or, that someone who
>simply drinks herbal teas and has never studied any further is simply just
>not worthy of the flavor or experience of those teas. All these things are,
>basically, hobbies--and we decide when entering these hobbies just how
>"devoted" we will be to them.

Sure. But none of the hobbies you mention uses a limited, shared resource that others want. A backyard gardener does not have to compete with the flower shop for supplies or ground to plant things in. Amateur radio operators have to compete for a slice of the radio spectrum.
>
>The ARS is not a measure of intelligence, success, or even influence.

Not to you, maybe.

>It is
>a hobby, gentlemen, first and foremost.

The same could be said for volunteer firemen. After all, they don't get paid and
they can quit any time.

> Be it good or bad, I believe the

> The hobby arena is the place people
>come to "get away" from the pressures of education and profession. The more
>you fight to try to make it some kind of educational arena, the more you'll
>find the youth staying away. They've got enough, without hearing and
>listening to how incompetent they are because they only want a hobby and

>nothing more.
>
I don't think so. If that were the case, young people would not want to be Eagle Scouts, or rise to other challenges.

Next month the Winter Olympics will come to Salt Lake City. Most of the athletes will not win, nor receive any money or lasting fame for their efforts. It's just a
"hobby" for them.

Many major cities have marathons. Running 26.22 miles requires lots of training

and dedication. Yet most of those who run marathons will never win any prize or sponsorship. It's just a "hobby" for them.

Perhaps we should shorten the marathon distance to 5 miles because "it's just a hobby". Lots more people would run marathons if we did.

>Why is it that great philosophers, inventers, speakers, scientists,
>musicians, etc., why are they almost always *not* from the United States?

Well, for one thing, the US population is only a few percent of the world population.

But if you look carefully, the US produces far more than its share of great philosophers, inventors, speakers, scientists, engineers, musicians, etc.

Just look at the history of radio/electronics. The amplifying vacuum tube, transistor, integrated circuit and microprocessor were all invented here. SSB, FM, color TV, and the all-electronic digital computer are American firsts.

>Everything here in the United States is so very judged--we demand perfection
>in everything we do; when sometimes all we need and want is to just "pick up
>a microphone and argue, or chat, or frolic" [in the case of amateur radio].
>I know many Europeans who come over here and are at first amazed, then
>feared by, our work ethic; our harried lifestyles; and the way we choose to
>"enjoy" ourselves.

Maybe that's what YOU want. The success of the USA is based on the fact that we are always a little unsatisfied and looking for something better. That requires judgement.

Look at the computer in front of you. It's the result of a "very judged" attitude that
is not satisfied with the way things were. Lots of judgement.

Or consider political philosophy. The idea and practice of separation of church and state began here. The concept of meritocracy rather than inherited nobility is another example.

The FCC heartily disagrees with that view. In the very first article of our rules and regulations they outline the "Basis and Purpose" of our Amateur Radio service. Two of the five clauses in that "Basis and Purpose" involve training/education.

"rules which provide for advancing skills in both the communications and technical phases of the art."

"Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts."

Doncha just hate it when someone spoils your rant?

With all kind wishes,

There is more "stuff" to being a ham today. There is not much more to being a ham. It is my understanding that spark gap dictated that rigs be homebrewed, right? It is my understanding that one used to have to build to get a ticket, right? It is my understanding that one had to draw, er, something to get a ticket, right? That is my definition of "more to being a ham in earlier times."

>
> Those folks used Morse code, AM phone, 60WPM RTTY,

>

Well, that's true--and it's also an entirely different can of worms. I say that because the "hams of yesterday" who always want to jump on the bones of

the new hams probably couldn't answer to most of the technical aspects of those modes you mention above. But, on the other hand, we newer hams can just run out and buy the rigs that will do the above modes and, ourselves, don't even have to *really know* how they work.

Well, I would quite consider someone who was willing to do all that as being far more elite than I. I really would. If ham radio took *that* much effort, I certainly wouldn't be interested.

No, Hans, I don't "hate" it at all. Good points of view are the meat of
great discussion. It's the namecalling, slurs, and intelligible rants that
spoil. Anyway, you're absolutely right, the FCC Basis and Purpose, etc.,

does say all that and all those good things. However, it is my opinion that those documents will stand long after the original intention has changed dramatically. Other government documents say lots of stuff that we'd be hard pressed to bring to task today.

Additionally, the basis and purpose applies to ham radio service.
The FCC has never subscribed to the concept that any one ham
had to meet all the reasons for the service as stated.

Cheers,
Bill K2UNK

Dick:

What's the deal about not using a slashed zero {ï¿½} on an R/C plane?
Anyway, most R/C'ers would use their AMA number on their planes,
not their ham call (if any).

QSL the anal AMA types. R/C got too much like work, kept me out
of flying in contests for years. I just want to go somewhere and bore
some holes in the sky, without having some self-important "Safety
Officer" micromanaging me every step of the way. My Dad and I
used to have a joke between us that R/C flying was the third leading
cause of death in the U.S.A. But we solved our problem by buying
50 acres for flying off the ground, and lakefront vacation property for
flying off the H2O. BTW -- know any source for new, single-stick
R/C transmitters? We (mainly he) is/are still using old Kraft/Futaba
single-stick TX's dating back to the 70's.

I used to spend hours flying a "Middle Stik" with a K&B .40, making
inverted passes low enough to break baloons staked to the ground,
with a large sewing needle stuck in the top of the rudder! A few times,
I'd "flame out" making the pass...no problem -- roll over, and set it down!
I also tried "carrier landings" with arresting cables made out of
parachute line and bungee cord. Never got around to perfecting that
technique -- I joined the Air Force, not the Navy!

Jesse:

All you'd need is a Technician-class ham radio license. 35 multiple-guess Q&A's, pay a nominal fee, and you've got it. However, why would you want to use 50 MHz to fly R/C? One of the most popular uses of 50 MHz transmitters is to shoot down expensive R/C planes! I'd stick with the 72 MHz R/C freqs -- there's plenty of 'em, and no license is required. Most of the 50 MHz R/C'ers are bootleggers who don't know what they're doing, anyway.

Ed:

Actually, I've spent most of my ham career proving the value of skill over brute force. I can work anyone I can hear, and I can hear a lot more stations than I have time to work! I had one of my most enjoyable QSO's in a long time the other night, with a guy in CA using 10 watts to an attic dipole -- and I was using 25 watts to my indoor dipole in my apartment. We exchanged 559/579. No problem. I then worked a bunch of Russians having some sort of sprint contest. Ripping good fun. I pity anyone who doesn't use CW! They don't know what they're missing!

See you later...gotta Czech the PacketCluster.

And, as I just posted in response to Hans, you're absolutely right. However, I think the Basis and Purpose is getting to be more and more of a historical notation, rather than an accurate belief of what the FCC thinks of the ARS. Just my opinion, mind you.

> services.
>

OK, then I'll reword, Jim. A practicing MD, in the business of practicing medicine and having patients, in not in *any* avocation, as related to his education. I think it is a given that people are not required to follow up through profession what they have mastered in continuing education. I wasn't sure that point had to be made. :|

>
> And there are plenty of MDs and other medical professionals who volunteer their
> services for little or no pay. Lawyers do pro-bono work. I know engineers who
> have provided services for free to support a good cause.
>

I don't know what your reference to "volunteerism" is intended for. My point is that there is no requirement that a ham operator be a volunteer at all. My point is that ham radio is probably, first and foremost, a hobby for most people. My point is that the requirements (or lack thereof, depending upon which side of debate you come from) for a ham radio operator--and whether a person wishes to meet them or not--should not then be translated into a formula for how that person would approach other things in their life. For example, for the *hobby* of ham radio, I was willing to put forth only minimal effort. For my job, I willing to do *nearly* whatever it takes to be successful in my workplace. For my husband, I am willing to do *whatever* it takes to make our marriage a success. For my yard to look pretty, well, in Texas, I give up...LOL

> radio exams look like a piece of cake.
>

Actually, I don't think I am the first to make the comparison. But, regardless, it is germane to the comments I was making. Haven't you ever seen someone say, "The ARS is getting so damned dumbed down because you creeps who don't want to learn CW want *everything* in life handed to you."? That's a piss poor analogy.

> >

Excuse me, if there is a gardener next door to me that has just decided that 3X the amount of recommended malathion will work faster and better than the prescribed amount, there is a problem, a HUGE problem. And, if that gardener allows their overspray to eliminate the true organic nature of my vegetables and herbs, there is a problem. Backyard gardeners may not overtly have to compete for space, but in reality they do. And, they should maintain "their" space so that it will spread nicely to others' "spaces" and into "spaces" for the future.

> >
> >The ARS is not a measure of intelligence, success, or even influence.
>
> Not to you, maybe.
>

Oh, 'scuse me. I forgot to add, "in my opinion." And, I don't see it as a measure of any of the above. I mean, *just because* someone is an amateur radio operator doesn't necessarily mean squat.

> >
> >It is

>

I'm not measuring distance or time. I made the general observation--and I think I am correct--that hams of yesteryear *had* to know more than we do today to get a rig up and running on the air. I am under that impression because I don't think one just trotted out to the local radio shop, picked up a radio, brought it home, plugged it in and talked to lands across the world. To me, those are the more admirable people, the people that--(sigh) *in my opinion* did have to know more and were among the elite.

Jim, when I post I am posting to the group. Shall I make a list of all the qualifiers I must now use in posts:

A. I will remember to use the phrase "in my opinion" so that it is clear I am posting my opinion and not the opinion of someone else
B. I will head each and every post with the salutation "Group" for the benefit of having everyone understand that I am posting to a discussion, not to a person

What else would you like, Jim? See? *THAT* is a direct comment to *YOU*. How can we get that into some kind of recognizable format?

> >
> >Then, ask yourself if you understand so well how those "new" modes

Many of the teachers my children had in Ft. Worth public schools developed curriculum of their own that was quickly quashed by the District because it was outside their standards. When you post your opinions (they *are* opinions, are they not) from now on, would you like me to ask you, "Jim, who is qualified to say that?"

>

I don't know how or why, but amateur radio and things like it are different. Scouts is mainstream, maybe. I don't know. But I think you'll find far more young people involved in Scouting than you will find involved in ham radio. Of course, that's obvious--in my opinion.

>
> Next month the Winter Olympics will come to Salt Lake City. Most of the
> athletes will not win, nor receive any money or lasting fame for their efforts.
> It's just a
> "hobby" for them.
>

It probably is a hobby for them. So, where is the sacrifice in ham radio? You mean we are supposed to revere someone who chases paper? We are supposed to revere the contester in ham radio who goes to the store, buys equipment, even pretty logs, as much as someone who gets to the Olympics? And, I better clarify that statement for you, Jim. It is my belief that most (not all, but most) people in ham radio *do not* build their rigs today. Most, in my opinion, don't even build their antennas.

>
> Many major cities have marathons. Running 26.22 miles requires lots of training

Probably. See above comments. What, in ham radio, is the high success that we should revere, Jim?

>
> Perhaps we should shorten the marathon distance to 5 miles because "it's just a
> hobby". Lots more people would run marathons if we did.
>

Now, you are getting way off topic and ridiculous to boot. Here is my comment, short and simple: the measure of education in the educational arena, should not be measured against ham radio in terms of effort put forth. Ham radio is a hobby. Getting a ham license easier, cheaper, and with less effort has nothing to do with the effort someone would put forth in other things in life.

The ease of getting a ham radio ticket, or the difficulty of getting a ham radio ticket--is not an accurate measure of the effort one will put forth for other more important things in life.

Ed, I wish I could remember this with the clarity I'd like to have, but here goes. At the Texoma Hamfest a couple of years ago, there was a guy (can't remember his call) who makes the "tiniest CW rig in the world." This thing is, I think, solid brass, and is probably no more than 1.5" square. WOW, and the darned thing works, looks pretty, and provides conversation as well!

I see. The original Affirmative Action programs got Dr. King spinning
in his grave; now he's just hit about 1,000 RPM. We should at least
hook some kind of generator up to the poor guy! Got any more
brilliant ideas?

I think you're a racist, trolling wanker. Is that thoughtful enough for
you?

CSCE? Fill in the blank? Didn't have those either. Had to pass the code and written in the same session or do the whole mess all over again. No second tries for a second fee, either - they said "go home and come back after at least 30 days - when you're ready".

Q. What do you call an anti-coder with an Apple computer?
A. An iTard.

Q. How many anti-coders does it take to screw in a light bulb?
A. Only one. But none will try.

Q. How can you get an anti-coder to speak intimate terms of endearment?

A. Super-glue a picture of Al Gore to his mike.

Q. Why did the anti-coder smear grease all over his antenna?
A. So dem SWR's will slide right off!

Did you hear about the anti-coder who made ten pit stops at an oval track race?
One stop for gas, the other nine for directions.

An anti-coder goes into a ham store and picks up a 50 foot roll of coax. After staring at it for 10 minutes, he was asked what he was doing. He said he was trying to figure out which end went to the radio and which end went to the antenna.

Q. Why were the roomful of anti-coders crying?
A.. The local welfare office closed for a month.

I got into, and out of, RC in the 80s at the urging of another ham, a dentist whose undergrad degree was in aeronautical engineering. I gathered the 72 MHz freqs were new at the time or some major change had been made because the emphasis was on being 'narrowbanded' and picked up some 53.3 gear (cheap) to avoid the bullshit.

Built a simple-minded trainer for no better reason than I needed the training and for lack of anything better to do put my call sign -- hey it started with an 'N' didn't it -- on the wing and roared off to bore holes. So I am having fun doing touch-and-gos on a dead day at the RC park when the goon squad approaches. The opening line was 'I don't recognize your flags' to which I said 53.3 and got a dumb look. I was also informed that the FAA does not put the on airplanes and this was highly irregular to which I said the whole plane was not a model of much of anything except a highly forgiving airframe suitable for a rookie who was likely to reduce it to balsa scrap pretty soon anyway. It turned into a pissing contest.

So at the next meeting -- finding that two of the goon squad were club officers -- burned my membership card publicly. Sold the radio gear, cheap, in a package to another ham so he and his kid could bore holes. Ha, ha, ha.

The only group more hostile to newbies are handball players down at the Y.

Tuning up with the antenna is usually done because the setup requires it, not
due to lack of a dummy load. Unless the antenna presents the same complex
impedance as the dummy load, tuning up with the antenna to be used is
usually necessary.

>> Yup.
>
>Having acknowledged that...don't you see such
>a "ham only" mode having that as a shortcoming?

Sure. All modes have advantages and shortcomings. PSK31, for example,
requires a suitable rig/antenna, computer, software, interconnections and
skilled operator. Plus a power source for everything.
>
>> >Most other modes allow for
>> >anyone to be the operator and the ham can "be there"

Same way you send them on voice. IOW, voice is equally poor for sending
images.

>> There is also the fact that common voice modes can be intercepted by
>anybody
>> with a receiver.
>
>And that worries you?

It's a disadvantage. Rumors get started that way.

> Why? We're talking
>emergency, not a war effort.
>
There are plenty of situations where emergency personnel may not want their conversations
to be wide open to the entire world and media. Of course we hams cannot use ciphers or
codes meant to disguise or hide the content of communications, but you must admit that
voice modes are easily intercepted.

Here's an example: Suppose their is a disaster that results in missing, injured and dead people.
Suppose the emergency personnel need to send unchecked lists of names out of the disaster area,
and they ask the hams involved to do it. Wouldn't it be smarter to send those lists by a nonvoice mode?

It has come to the attention of the Democratic Leadership that there is to much Discrimanation of the Mentally Challenged in Ham Testing. And as such a new Procedure is being drafted to stop this.
The new procedure will only require a Welfare Card and Membership in NCI.

>Don't take this necessarily as a slam to QST magazine, I just don't read it.

Too bad you don't find anyhting else interesting in QST, Kim.

I'm looking at the Feb 2002 issue, and I see:

- one page editorial on funding the ARRL
- two pages of regulatory news
- three pages of picture stories, including some truly amazing homebrew
projects
- two pages of letters to the editor
- five page APRS tracker-encoder construction project.
- three page slide-rule dial project
- two page protable dipole project
- four page article (second of two) on digital voice.
- three page article on a "DXpedition" to a Chesapeake Bay island that resulted
in
lots of good fun and at least two new hams
- three page article on a cross country motorcycle trip using ham radio
- three page article on getting media coverage and a special events station
that
got lots of good publicity for the ARS
- four page article on ham radio and the NYC Marathon
- articles on a new award for PR work and a fishing/hamming expedition in
Quebec
- three page project for a CW generator and audio distribution system for
clasroom instruction
- nine page Product Review
- Columns:
"The Doctor is In" (2 pages)
"Test Your Knowledge" (1 page)
"Short Takes" (1 page)
"Hints and Kinks" (3 pages)
"Technical Correspondence" (3 pages)
"Happenings" (6 pages)
"Public Service" (3 pages)
"How's DX?" (3 pages)
"World Above 50 MHz" (4 pages)

"Amateur Radio World (2 pages)
"Old Radio" (2 pages)
"YL News" (1 page)
"QRP Power (2 pages)

Also contest results, upcoming contests and special events, section news, strays, new products, new books, and a bazillion ads. All in a nice 175 page package.
Total cost $3.25 per issue if you subscribe.

>My membership is for the benefit of people not being able to say "you're not

The spark era ended more than 75 years ago. Equipment was almost all homemade
back then
because few radio manufacturers existed.

> It is my understanding that one used to have to build to
>get a ticket, right?

Wrong. Some foreign countries had such requirements, but not the USA. Ever.

> It is my understanding that one had to draw, er,
>something to get a ticket, right?

Wrong.

Drawing schematic and block diagrams used to be part of the written tests. They
were
phased out in the late 1940s and 1950s and were gone by 1960. More than forty
years
ago.

I would venture that one could get a ham license as long ago as 1950 without
drawing any
diagrams correctly.

>That is my definition of "more to being a
>ham in earlier times."

Here's a question:

Why don't you want your GUNS licensed, but you want your RADIOS under strict government control?

A radio is as useful a tool against a corrupt or failed government as is a gun.

BOTH should be free and unlicensed!

If the government won't do it, maybe we should.

Make a "voluntary" 20WPM test (a REAL test, like they did when I took it, not a multiple-guess test), and keep an online registry of REAL EXTRAS who passed this test.

See if we can get sites like QRZ.com to include the info as to whether or not the person passed the 20WPM test and is a real extra or a no-code extra.

That's not really true. Given the complexity of 802.11 even a big ASIC
implementation is likely to have its basic functions controlled by
programmable firmware (with sufficient complexity there will always
be bugs, and most vendors prefer to keep the complexity in firmware, where
it is easier to fix, rather than in ASIC gates, where it is tough) as well
as the programming interface presented by the chip to the processor it
is plugged into.

While manufacturers usually keep the firmware to themselves they often
provide the programming interface to people to write driver software
and this will sometimes support broader functionality than is strictly
necessary for the intended application. For example, I can tell from
the Linux driver for it that the Breezecom 802.11 FHSS card appears to
be programmable with a fully custom hopping sequence, so someone with
sufficient motivation could probably get it to keep to the lower 50 MHz
of the band despite the Part 15 violation this would represent.

>A very strong Amateur signal could make the Part 15 operator just as unhappy as
>you are. :-) And they are offered NO protection against interference from
>Amateurs. The best "defense" of our bands would be to use them heavily.

That's interesting. The law here requires that known defects in a house be disclosed by the seller, and the real estate agents have a questionaire for the seller to fill out which is designed to satisfy the legal obligation. I got to look at one of the questionaires recently and couldn't help but notice that two of the defect questions were, approximately "Are you aware that any of your neighbors is an amateur radio operator?", and "To your knowledge has any of your electronics been interfered with by the transmissions of an amateur radio operator?", from which it is hard to miss the implication that amateur radio operator neighbor == defective house.

The FCC wrote the laws forcing these unlicensed applications into the 900 MHz and then the 2.4 GHz band, not to mention the 5.8 GHz segment of the high-falutin'-sounding Unlicensed National Information Infrastructure bands where the data equipment is likely to end up once it becomes clear that 2.4 GHz is already overcommitted. They have no where else to go, either the equipment works here or you do without. If it turns out that sharing these bands was a mistake and is impossible to do without frequent mutual interference between services, I wonder which service the FCC will restrict to resolve the issue?

Such a pity.

10 WARNING SIGNS YOU MAY BE TECHNOLOGICALLY IMPAIRED
(From http://www.satirewire.com/features/siliconpines/acf.shtml)

Being technologically challenged or impaired is nothing
to be ashamed about.

In fact, millions of people suffer from it daily.
Many, however, don't recognize their condition, and
unless they talk about it, these people are often
difficult to diagnose. It is our sincere hope that
the following list of Warning Signs may serve as a
guide to help you, or someone you know, make an
informed decision.

After sending someone an email, you phone to tell
that someone that you've sent them an email.

All your bookmarks are tech support sites.

Look at your email address. Does it end in "aol.com"?

You keep forgetting which side of the mouse you use
to "right-click."

All your bookmarks are genealogy sites.

When your computer freezes, and someone tells you
to turn up the heat in the room, you actually do it.

When installing software and it asks if you want to
do a "normal" or "custom" install, you get upset that
there is more than one option.

You say things like, "With my new 850 Mhz machine, the
Internet is much faster."

You ordered a computer with a CD-ROM, but instead it
came with a stupid cup holder.

You are told about viruses such as ILoveYou and
warned not to click the attachments, then the next
day you get an ILoveYou email and click on the
attachment because, well, it came from someone you know.

If you recognize any three of these signs, you may be
in need of an evaluation by a Licensed Techcare Professional.
If you recognize five or more, you may be suffering from a
more serious condition known as Reinstallzheimers. Seek
help now.

WARNING WARNING WARNING

Humor Impaired individuals may be offended by the following
and should depress the -->Next button NOW.

Came across this old gem on my hard disk. I'm not sure of the original
author (I *think* it is Danny, K7SS, of "QRP is for Sissies" fame)

Enjoy.

News Release:

QCAO Reorganizes

The Quarter Century Appliance Operators was founded in the
early 1950's by a small group of Amateur Radio operators from
the Pacific Northwest. They had been active in their hobby for
over 25 years, yet still lacked the basic knowledge of radio
electronics and had no idea of how their equipment worked.

They banded together to try and protect each others honor
and pride. At radio gatherings and club meetings in the 1950s
one was considered unworthy of the name Ham Radio Operator if
he or she couldn't not only name components, but know how to
solder them together and make a radio work, or fix a broken set!

When faced with insults and dreision, those few hardy
pioneers banded together and formed the First Chapter and
National Organization of the QCAO. This was known as the "Cold
Solder" Chapter. They even coined the now-famous club byword
"e pluribus ignoramae" which is Latin for "We don't have to know
how to solder, we just wanna talk on our radios."

No veterans of that first chapter are known to be active on
the air today. In the late 1950s and early '60s, with the
worldwide interest in science and space and technology, the QCAO
membership went underground.

It is with great pride and dignity that today in the 1990s
the revived QCAO stands ready to rise from the ashes, and become
the standard of mediocrity it once proudly was. In honor of

those first pioneering members, QCAO hereby invites all eligible applicants to step forward and join!

The benefits of QCAO include not only the pride of membership. Think of the warm glow you will feel at club meetings and gatherings showing off your new all-plastic imprinted QCAO pocket protector! And that's not all! For your minimal membership fee, you will also receive a handsome, suitable-for-framing, certificate of honor, with hand-lettered name and Charter Membership Number. Other QCAO memorabilia will soon be available for members, including T-shirts, caps, pins, etc. At this date charter membership numbers are still available. Membership requires a 25 years (more or less) interest in Amateur Radio, coupled with a basic ignorance of how radios work and how to repair them.

Think of meeting other QCAO members on the air! No more embarrassing pauses when someone in the QSO mentions an RF choke or a parasitic bleeder...Be able to exchange meaningful sharing, talk about real things, yes, even swap QCAO numbers with each other! And soon perhaps . . . a worldwide QCAO contest!

You no longer have to shrink to the back of the room at post-meeting sessions of your radio club. Just display your QCAO protector and others will be able to identify you immediately. Who knows? Perhaps one of the originals from that old QCAO Chapter is just waiting for you to find him. Join now! Remember "We don't have to know how to solder, we just wanna talk on our radios"! Don't let technoids embarrass you and kick jargon in your face. Stand up for what's right! Join QCAO!

"e pluribus ignoramae"

Having a paper route to pay for your hobby is 'elite'? Scrounging
spare parts from someone else in the hobby is 'elite'? Folks who do
those things are 'far more elite' than you? "That much effort" would
cause you to lose interest? I'm no longer sure you would even qualify
for membership in QCAO! Perhaps Bill Sohl will grant you membership
in NTI.

With all kind wishes,

de Hans, K0HB

Carl is saying that's the main reason people join the ARRL.

> I get my QST and it lays around.

That's the impression one gets from reading your posts.

Qualified but wouldn't be caught dead at a meeting let alone apply for
membership.. But then I feel that way about QCWA as well.

You really should obtain a copy of Part 97, Kim. That way you would
actually know what it says before you lecture to people about it.

So let's see if I got this right. I already "volunteered" for a 20 WPM test, and passed, but since then I got a vanity callsign, which automatically renewed my license. Now you can't tell from the FCC data base when I go my Extra, before or after the regulation change. In a couple of years you won't be able to distinguish when any of the licenses were originally obtained. Which, as far as I'm concerned, is great.

But, now you want me to "volunteer" for another 20 WPM. Maybe you should take a pole to see how many "REAL EXTRAS" are willing to take that test again. Your logic is worse then the troll that started this thread, but it is funnier.

This is why I won't change my callsign even though it's "out of district." I
don't want people to think I'm a no-code extra. I don't even trust the VEC
system, we all know how much cheating there is there.

It's intended to show that many professionals volunteer their services
as an
avocation, even though they don;t have to.

> My point is that ham radio is probably, first and foremost, a hobby
> for most people.

That depends on what you mean by "hobby". If you mean something done
for
its own sake without any expectation of being paid money, then I agree
that ham radio is a hobby to most hams. If you mean there should be no
standards because it's "just a hobby" then I disagree.

> My point is that the requirements (or lack thereof,
> depending upon which side of debate you come from) for a ham radio
> operator--and whether a person wishes to meet them or not--should not then

From my life experience I say it depends entirely on the individual.

It is one indicator. For many some people it's an accurate indicator
and for
others it's not. Depends on the individual.

> > >The ARS should *not* be in the business of being so discretionary when

> prescribed amount, there is a problem, a HUGE problem.

Sure - because that person's mistake can harm others. But it has
nothing to
do with the point I was making.

The radio spectrum is a very limited resource that many different
potential
users want. In most cases pieces of it cannot be shared for practical
reasons.
The govt. decides who gets what based on merit.

For example, hams cannot be allowed to transmit on the frequencies
used by TV
broadcasters because of potential interference.

Gardening is completely different. Anybody with enough money can buy a
piece of ground suitable for gardening and have at it. As long as they
stay inside their
property lines and don't threaten the safety of others they OWN the
garden. Not
so with radio frequencies.

> And, if that
> gardener allows their overspray to eliminate the true organic nature of my
> vegetables and herbs, there is a problem. Backyard gardeners may not
> overtly have to compete for space, but in reality they do.

HOW? Is there not enough land available? Must gardeners justify their
use of the soil to the feds, or have it taken away and given to other
users without
any compensation? Not that I can see.

Consider why we lost 220-222 MHz. The land mobile services convinced
the FCC
that they needed those freqs. more than we hams did. The FCC decided
that it
was in the public interest to reallocate those 2 MHz. The same is not
true
of gardeners.

> And, they should
> maintain "their" space so that it will spread nicely to others' "spaces" and
> into "spaces" for the future.

Sorry, you gotta explain that a little better.

The only analogy that makes sense is that hams have to stay inside
their bands
the same way that gardeners have to stay inside their property lines.

> > >The ARS is not a measure of intelligence, success, or even influence.

OK - that's true. It took a bit more basic radio knowledge.

> I am under that impression
> because I don't think one just trotted out to the local radio shop, picked
> up a radio, brought it home, plugged it in and talked to lands across the
> world.

That basic description was possible at least 50 years ago. Probably
more.
Manufactured ham gear has been around since before WW2.

> To me, those are the more admirable people, the people that--(sigh)
> *in my opinion* did have to know more and were among the elite.

You're gonna give me a swelled head, talkin' like that.

> > > Before you begin to defame someone the next time you

> > When have I defamed any individual for how they got their license? My
> comments
> > are about the requirements themselves.
>
> Jim, when I post I am posting to the group.

Then make it clear who "you" is supposed to mean. When someone replies
to a
post and says "you", it's clear they mean the person who wrote the
post they
are replying to.

> Shall I make a list of all the
> qualifiers I must now use in posts:
>
> A. I will remember to use the phrase "in my opinion" so that it is clear I
> am posting my opinion and not the opinion of someone else

All you gotta do is put "I think" or "seems to me" in the sentence to
clarify

what's a fact and what's an opinion. For example:

"I took the Extra test in August 1970" (fact)
"Seemed like it was a better test than today" (opinion)

> B. I will head each and every post with the salutation "Group" for the
> benefit of having everyone understand that I am posting to a discussion, not
> to a person

How about:

"Before A begins to defame B because B worked differently to get B's
license,
A should just think about all the new things that have come out since
A got
A's license."

Much shorter and clearer. And it applies both ways, to old timers and
newcomers.

> What else would you like, Jim?

Some clarity in writing would help. Fewer assumptions about us
old-timers.

> See? *THAT* is a direct comment to *YOU*.
> How can we get that into some kind of recognizable format?

See above.

Writing is easy. Writing clearly isn't.

> > >Then, ask yourself if you understand so well how those "new" modes
> > >work, and how to experiment with them.
> > >
> > I do understand them, and how to experiment with them.

> was outside their standards.

That's ONE school system in ONE district, years ago. But you made a
blanket statement about schools in general, as if they are all that
way. My local
public schools are not that way at all.

> When you post your opinions (they *are*
> opinions, are they not) from now on, would you like me to ask you, "Jim, who
> is qualified to say that?"

Much of what I post is verifiable facts, not opinions. And it's clear
NOW
that you meant your local public schools. It wasn't before.

More young people are involved in Scouting in large part because it's
a general

purpose program FOR young people.
>

> It probably is a hobby for them.

The point is they take it seriously.

> So, where is the sacrifice in ham radio?

Why should there be sacrifice? What I'm talking about is commitment
and
accomplishment.

> You mean we are supposed to revere someone who chases paper? We are
> supposed to revere the contester in ham radio who goes to the store, buys
> equipment, even pretty logs, as much as someone who gets to the Olympics?

There's a bit more to it than that, Kim.

> And, I better clarify that statement for you, Jim. It is my belief that
> most (not all, but most) people in ham radio *do not* build their rigs
> today. Most, in my opinion, don't even build their antennas.

Probably true. But many of us DO build our own equipment. Including
antennas.
Heck, I built the dern TABLE the equipment sits on.
> >
> > Many major cities have marathons. Running 26.22 miles requires lots of

> prize
> > or sponsorship. It's just a "hobby" for them.
>
> Probably. See above comments. What, in ham radio, is the high success that
> we should revere, Jim?

All sorts of things.

- The homebuilt equipment
- The public service
- The skilled operation of any sort
- The development of the new
- The preservation of the old

How?

Is running a marathon an admirable accomplishment or not? Nobody has
to do
it anymore. Contests are just like radio marathons.

Your opinion duly noted. Mine's very different. I say it depends on
the individual.

I don't look at it as a problem, but there are those who have indicated they do. I can't tell you how many times that I've been told in the "old days" how rigs had to be built, etc. Maybe I've given too much over to believing what I've been told, eh?

Regardless of *why* one tunes using an antenna, it is not a good excuse to avoid following FCC R&R just because something is too hard. I tune all the time on my antenna, or do when I am on HF.

I'd have to read the entire thing, Hans, and I don't really care to. I know what the Basis and Purpose state. I suspect there's a great deal of Part 97 that says things that aren't really subscribed to by the FCC or anyone else. How 'bout the part about RACES? I just went through a good local debate here early last year with people who state that it is the FCC's R&R that say a non-RACES station cannot enter a RACES net. I don't read it that way in the FCC's R&R. I was told that was what the FCC's *intention* was. I still don't believe it, and don't read that in the R&R. I read that it is entirely up to either the governing agency for RACES operation, or that the authority can be "given" to the RACES Radio Officer. That's a far cry from the FCC *saying* and *intending* that a non-RACES station is barred from entering a RACES net (irregardless of emergency conditions at the time). But, I digress.

Not by my read of what Carl has said of late. He said that some people join ARRL just to receive QST. I think he is in the dark as I am as to what percentage. I personally think that most people who join ARRL do so to help with ARRL's efforts to preserve Amateur access to spectrum, but that is just how I see it. Of course, that represents the majority of my work, so naturally, that is my view. :-)

I wasn't aware that I'd placed a timeframe on the history I was talking
about. My mother grew up in Oregon in the 1940s (roughly). Her father was
a logger. My mother would not have been able to just pop into the local
radio shop and get a radio. The lack convenience and finances would have
been reasons why it would be impossible. My father grew up in Brooklyn, NY.
He probably would have had a better chance but, again, finances would have
been lacking.

Pshaw. I "learned" CW enough to get my license. I don't think I could
learn about how a radio operates, or understand propogation theory, and then
forget it all after a short time.

You guys must be thinking of the word elite in some derogatory way, which is
certainly one way the word can be thought of. I am using the word as
meaning that the folks of yesteryear certainly put forth more effort than I
did/do for ham radio. I don't have a problem with that at all. I highly
respect them for it. If they started pounding it into my head and *acting*
like an "elitist" (used in the derogatory), then I'd have a problem with
their attitude--*NOT* their history.

Well, Hans, I've never made a secret of my belief that I put forth little effort for ham radio. My pleasure in ham radio is simply picking up something that is already put together, with a working microphone attached, and talking.

And, yes, if the definition of elite is something along the lines of "cream of the crop" then the folks who scrounged via paper route or spare parts is far more elite than me. If I can't save my money--and quickly--and walk into a store to buy what I want, then I lose interest quickly where ham radio is concerned. I have never really professed to be any more than an "appliance operator." I don't feel the least ashamed or bothered by it, either.

Yeah, it *does* muddy the waters when people begin arguing points like that,
doesn't it? :o I just don't have time to read the rest of this...sorry.
I've been writing longer posts than normal, and they are eliciting longer
responses than normal. I just don't have time...

] gun.
]
] BOTH should be free and unlicensed!

I do want the guns licensed. Goverment control can be abused, but it
can also be useful. I am not a proponent of severely limited
government. On the other hand, none of us want bloat-ware. The trick is
to find the happy medium. We have seen what can happen to an unlicensed
radio service in the CB service. I say lets not dumn down the amateur
service by removing those few hurdles required. If my 13 year old son
can get his license than so can other people, but only if they put in
the effort like everyone else.

Why don't you guys stop worrying so much about what others might think
and strike out on your own. If you want extra, go for it. Only two
entities need care about what/who/when/how ... you and your "higher
power" (aka God). I don't give a care about what others think of my
licensing, nor should you.

For the record, I am a proud no-code tech. I have nothing against the
code, in fact I am studying for the upgrade now. Code/no-code doesn't
make or break the man/woman. Let go of it and move onward!

Absolutely tripe delicious!!!

A typical Kim Q'

kim-roger d doger there the name is kim that's k as in Kim eye as in
island an em as in mary

you're 59 lemme tunr the tpower down what am i hitting you with now

let me turn it down some more ok how the copy over roger do you qsl my
lower power

Geez by the time you're done fiddling with your knobs the qso is over
due to sheer boredom

R & R?? lemme see

Repair and replace (from a current auto mechanic shop form)

Rest and Relaxation - as in lovely Quam in the summer of 1970

R & R from my ol stomping grouns 8th TFW Ubon, Thailand

Rescue and retrevail

so which is it Kim

> Kim W5TIT

Gee KIm, who sets the minimal? The FCC states the minimum power
required. Mr BILL..ooohhh nooo, categorically states that his
definition is correct as he knew the Ohio station was too loud for just
running stateside.

The FCC gives no minimum..a max yes, but nothing that categorically
states what the minimum is. It is a subjective statement left to each
ham. Most DXers use propagation charts and check the SFI to help
determine how much power is needed to reach different areas of the
world. Do you use these tools? Better yet, have you even got a clue as
to what they are?? I thin not

Better check your FCC R&R's again. you seem to be lacking substance
AGAIN!!!!

BTW, loved you on Springer yesterday.....

I'd venture it a safe guess that the vast majority of
people that might be involved in any way with
emergency comms are likly to have at least a
familiarity with a keyboard. One need not be
able to type quickly to keep the communication going.

> >> >That being the case, in an emergency ONLY

I'd debate the "skilled operator" needed. Once established,
the connection/comms don't really require
attention at all. Packet clusters are left to their own operation
all the time...no operator on hand at all.

>
> So? You still need a qualified amateur at eac end of the QSO.

There is a BIG difference in just "being there" vs having
to maintain the communication (i.e. as with CW).
Example...I can hand the mike to a Red Cross person and
that individual can converse with another station while I
sit back, drink coffee, read a book, etc. I can't do that
for CW where I'dd have to be sending/recieveing myself.

> >> >That allows the ham to let emergency

Granted...BUT the usual purpose of the hams being involved
is to HELP pass emergency traffic for others...not themselves.

> >> >Balance one againt the other? The world has

I truly doubt, under the conditions, that anyone would have
the time or inclination to care. It is TIME that is usually
the issue, not rumors.

Cheers,
Bill K2UNK

"Over-the-counter" rigs go back to before WW2. Anyone that
suggests otherwise should go research the QST archives.

Hans,

There is NO requirement that any one individual subscribe
to and follow the goals set forth in Part 97. The goals are
that of the service as a whole...not as any one individual.

Cheers,

>display frustratingly poor manners.

It is a given that poor operating manners cut across all license
classes, regardless of code testing status. That is not the issue.
The issue here is code testing as an amateur radio licensing
requirement. In over ten years of participation in this debate, I
have yet to see a valid argument against it. The simple fact is
that all but a tiny few people who try to learn Morse code can do
it; the few who can't could have lived normal lives without being
ham radio operators. I don't whine about not being able to ice
skate. I just live without it.

>I find your form of bigotry as distasteful as racism, sexism, and all

Dick:

Yeah. And I thought only OT hams were hostile to newcomers! I've
been reluctant to join a shooting club in Maryland for much the same
reasons. Don't want to endure the "FNG blues." Also don't want to
commit all my time to that one group, and tithe 10% of my income to
then. Just want to shoot on the range, pay normal dues, maybe help
out with some chores now and then.

I think it is more than a historical notation...BUT, it isn't expected that
every ham subscribe or support all the basis and purpose reasons.

I suspect "most people" will have similar disparities of "effort"
for different aspects of their lives. How is that any different
than what Kim states about herself?

> > > >Most people who take formal education are taking that education to

Most people are very poor at judging what level of "effort" anyone
else is puting forth to accomplish tasks, etc. The entire concept of
effort being any gauge of amateurs is a farce and a waste of time.
Amateur radio isn't "on the job" activity that requires such an assessment
to begin with.

>
> Your opinion duly noted.

If you are trying to pick a leader for your local emergency efforts,
then I can see making some estimate as to commitment...but odds
are it is only the commited that volunteer anyway.

> > > Are you saying that nobody should have any opinion about what other
hams

I suspect where Kim and I disagree with many others is that we
don't see "effort" being a requirement to be a good ham.
Your opinion may vary.

<SNIP>

Yup.

<SNIP>

> > So, where is the sacrifice in ham radio?
>
> Why should there be sacrifice? What I'm talking about is commitment
> and accomplishment.

Commitment in one area usually requires sacrifice in another. In the
end, however, the mix of hams that are commited vs those that aren't
probably isn't all that different today. There was a mix all the time there
has been hams.

> > You mean we are supposed to revere someone who chases paper? We are

None of my equipment today is home brew. Good ham or bad ham?
Commited or not commited?

> - The homebuilt equipment
> - The public service
> - The skilled operation of any sort
> - The development of the new
> - The preservation of the old

That is pure opinion. We each bring what we want to ham
radio, we take from it what we can and we repect whatever
we individually want to. Of the list above, I'd rank "homebuilt
equipment" the leats of what I revered on the part of another ham....
especially since the homebrew product could be a wide range
of finish, usefulness, etc. That doesn't mean anyone shouldn't
do and/or enjoy building their own...But rather, don't expect
that doing so earns any special regard in my opinion.

> > > Perhaps we should shorten the marathon distance to 5 miles because
"it's

> How?

Because it is a silly exercise. Infact, there already are 5 mile events,
5 Km, 10 km, etc.

> Is running a marathon an admirable accomplishment or not? Nobody has
> to do
> it anymore. Contests are just like radio marathons.

True, and I need not admire marathoners either. I do the vast
majority of repair/maintence work on my own antique cars. Many
people I know have no respect for that and wonder why I do so.
I do it because I enjoy it. The doing is MY enjoyment. I don't
give a damn if others like, dislike, respect or disrespect my
efforts. I personally think spending several hours knocking a
small white ball into 18 holes is nuts. I respect the "skill"
of those that are expert at it, but I have no inclination to
join their efforts. I find too many people that have some "if
you don't enjoy golf, or manicuring your lawn, that you are
somehow a nut case".

My perspective, as long as what you are doing is legal, ethical
and moral, then knock yourself out and enjoy it...but don't
necessarily expect me to also.

> > Here is my

forth
> > in other things in life.
>
> I disagree 100%.

So you do, but your disagreement suggests you expect strong,
dedicated commitment for anything anyone undertakes. That is
simply expecting too much of others. You are free to set whatever
standard you want for yourself, but you don't get to do so for
other people...Unless they report to you as boss/subordinates...and
then only for what you can legally require of them as part of their
employment. I have met many people that are dedicated to
their jobs and equally NOT dedicated to their families. As an employer,
how they treat their family is outside the scope of employer
judgement regarding compensation increases, etc.

There isn't a callsign today that couldn't also be held by a 5 wpm
extra... or a "nocode" extra once all morse testing is ended.

Cheers,

Forget this Code Vs. Nocode crap already...This hobby or Service depending
on your point of view is basically bleeding at the seams over this tiring
debate/flamewar....it don't matter if your a 13 WPM General or 5 WPM General
and weither or not anyone else knows that you rattle code off at 13+ - you
know personally that you are capiable of doing cw at those speeds so instead
of arguing like little children grow up a little and learn to get along.

and as for the socalled "freebanders " debate of them invading the amatuer
radio serivce
like a swarm of locust's we will see a few but not in the numbers the
naysayers are stating
the Typical freebander does not want to be shackled by rules or
regulations - they enjoy the anarchy that reins in between 27.405 - 27.995
Mhz so as far as i am concerned that argument is invaled.

Just my 1/50 of a dollars worth

Sometimes during an emergency, a little security might be a good thing. I might not want the whole world to know that "Aunt Sally" has just been crushed by a building until her next of kin has been notified. It also might be wise to limit the people who know that "Upton's Jewelry Store" has lost power. Using CW or secure voice would be a benefit here.

In article <20020122233654.11007.00000050@mb-md.aol.com>, Larry Roll
K3LT <yodoc@aol.comnospam> wrote:

] >I find your attempt at humor patently unfunny. There are many good
] >reasons to not pursue the CW endorsement.
]
] Name any two of your choosing, giving full explanations.

1. Desire. The motivation for the CW endorsement is increased license
priveleges. If one is not motivated for the additional priveleges then
there is no reason to pursue the CW endorsement. There are plenty of
the aspect of the hobby which can be enjoyed without knowledge of or
capability to use CW.

2. Time. Learning CW, more than the theory, requires a commitment of
time to practice, practice, practice. This is a personal decision and
should not be condemned because of your differing opinion. It's a
matter of mutual respect.

3. Choice. I have some ham friends who do not like to rag chew. They
don't like to contest. They like to fiddle with the electronics. For
them CW has no lure. There are other reasons to make this choice, all
personal.

] It is a given that poor operating manners cut across all license
] classes, regardless of code testing status. That is not the issue.

I would disagree. I never asked for the complete removal of the CW
requirements. I never asked for a lowering of the requirements. What I
did do was object to someone blatantly bashing "no-code" hams because
they are somehow less than those with code. The only way in which I am
less is in my license priveleges. This I can accept and I know how I
can (and will) change that. Those who bash often site the fact that us
"dumb" techs are ruining the world, the bands, the hobby, and anything
else worthwhile. My ability, or inability, to copy CW has absolutely no
relation to my operating behavior or ability (except for the
aforementioned priveleges). Please don't bash me, or others like me,
because of a label (especially one as dynamic as license class).

] The issue here is code testing as an amateur radio licensing
] requirement. In over ten years of participation in this debate, I
] have yet to see a valid argument against it. The simple fact is
] that all but a tiny few people who try to learn Morse code can do
] it; the few who can't could have lived normal lives without being
] ham radio operators. I don't whine about not being able to ice
] skate. I just live without it.

Then lets take the other tack. Give me two good reasons to test to the CW requirements. Does passing a CW test make me a better phone operator? Is CW a dead mode? Why is Amateur Radio the only radio service not to abandon CW? Is there something fundamentally wrong with not testing on every aspect of the hobby (i.e., CW)?

I certainly agree that testing is appropriate and necessary. I too share many hams frustration that some percentage of licensed hams are lids. I would argue, however, that the percentage of new hams that are lids are not very different than the percentage of old hams that are lids. If my theory is true, then it's not the new hams or the different requirements which make it seem like there are more lids, it's just a convenient excuse.

] >I find your form of bigotry as distasteful as racism, sexism, and all
] >the other forms.
]
] Don't tell me, let me guess -- you wear a pony tail, little round wire-
] rimmed eyeglasses, and have multiple ear rings! I just hope you're
] not HIV-positive as well, but that usually goes with your kind of
] thinking!

That was personal and low. I have short hair, might almost pass a military inspection. I am ex-Navy, with more than 8 years of proud service. I do not wear glasses (yet, although I suspect I will shortly). I have no earrings. I do not choose any of the alternative life styles which are at high risk for AIDS. I am, in fact, married with two children. I am a 30-something guy who works hard like the rest of you to keep a roof over my head and food on the plates. But for choosing to have a different viewpoint than you I am accused of being what you apparently feel is sub-par.

The whole point of my initial message was that it would be great if we could keep it above the belt.

I would argue that there is nothing wrong with Kim's approach. How many
of us built all of our radios, amplifiers, and antennas from scratch? I
bet the answer is very close to zero. Why didn't you? There are many
aspects of the hobby which require no ability or desire to repair a
radio or perform other feats of technical expertise. One of the
wonderful things about our hobby is the diversity it offers. Nothing
says we have to be interested in all aspects.

According to Kim precious M&M's or RR's, she is not in compliance. She
does nothing to advance the state of the art. According to Mr
Stevenson, EXECUTIVE Director of NCI, she is the embodiment of an FRS
user. Mr. S has stated many times over the years, people like Kim have
absolutely no place in amateur radio and are better suited in another
radio service like the FRS or CB.

>how rigs had to be built, etc. Maybe I've given too much over to believing
>what I've been told, eh?

Maybe, Kim. I don't think that most hams even in the 50s built their main rig. And if you don't count the Heathkits, the number of hams that literally homebrewed their stations was relatively small.

In 1963, I borrowed a homebrew rig from W1BNB (he had built it in the 1940s), and then bought used Heathkit rigs.

It was not 5 miles to school, uphill both ways, in the snow, with bare feet, with barbed wire on my feet for traction. I took a bus to school, bought used rigs and studied a 16-page study guide to get my General and access to ALL amateur frequencies as a result.

] a government "controlled" license. These are not words that NCI will like.
] I highly recommend that you join KCI. Oops, you want guns licensed. KCI is
] not for you either. I guess you'll just have to stay an Independent.

I have no idea the meaning of the acronyms you are using, so your point
is lost. But my position is clear to me. The government is not out to
get us. There can be too much or too little goverment. I like the
current balance both with amateur radio and with gun control. Both are
freedoms we can choose to excercise. Both have been abused in the past.
Both are presently regulated to (hopefully) limit further abuse. It's
not a perfect system, but it's the best we have.

Careful. Based on these admissions, and applying the rules of NCI (at
least as explained so far on this NG), you would have to be condemned
as a non-contributing member of the service.

I build stuff. I take technology and make it better. I am working on
allowing free Internet access on amateur frequencies via the use of SS
technologies, thereby ridding everyone the expense of ISP's. So far, in
wWestchester County, there are over 150 amateurs in a 20 mile radius
enjoying this service and it will keep growing

Who is Mr. Stevenson?

the EXECUTIVE Director of NCI and the keeper of the holy of holies PART
97. Mr S provides definitive interpretation of PART 97 and decides who
is and who is not worthy. Technoids are worthy, DX'ers are not.
Inventors like him are worthy, appliance operators like Kim are not

What is NCI?
The official registered trademark of the National Cancer Institute

If Mr. Stevenson
> does not work for the FCC why should I give a darn what he thinks of my
> application of Part 97?

Read the archives. MR S is more powerful than the FCC. Mr S with a
small tad of help from little Mr S personally took responsibility for
the great upheaval in 2000. It's all there. Mr S stated that through
his efforts, hams everywhere were free to get on HF a scream their lass
2's whereby he then condemned then for(1) no joining his NCI cult and
(2) not following the path of righteousness PART 97

>Regulations permit.

That would work IF the number of nocodetest hams in the USA were
significant enough to make a difference in director elections.

But I think it could backfire because you might find that such a move
made no big difference in the membership or ARRL BoD. NCI has
how many US members?

Consider this: Back in 1990, the ARRL BoD voted FOR a nocodetest
ham license, based on a number of factors. The Atlantic Division
director at the time voted FOR the move. FCC had made it clear that
they wanted a nocodetest license, and if the ARRL opposed it they
would lose all input into the process.

Same deal will happen in a post S25.5 world.

Kim, your verbiage above makes no sense at all. Sorry, but I've read it a
doizen times and it just doesn't compute.

"Tuning up" means adjusting the transmitter to match the antenna/transmission
line system. Older rigs, many tube-type linear amplifiers and most transmatches
require adjustment that cannot be done with a dummy load unless the antenna
just happens to have a perfect 1:1 SWR. It's not a question of being "too
hard".

Once the communication is established, and if the equipment and
propagation
are reliable. Such is often not the case - it all depends on the
situation.
Will the repeater/packet cluster be working? Will it cover the needed
area?

Sure. That's the one big advantage of voice modes.

> I can't do that
> for CW where I'dd have to be sending/recieveing myself.

Maybe you can't, but I can sit back, drink coffee, and even read a
book
while operating CW. (I used to do my homework during CW traffic nets -
and I was an A student). I can't eat/drink and transmit on voice at
the same time, but I can do so on CW. About the only thing I can't do
while using CW is
sleep.

And it's not just me - lots of CW ops have those skills.

It's still a concern - and with the heightened awareness of the need
for
better domestic security you may want to rethink that doubt, Bill.

> It is TIME that is usually
> the issue, not rumors.

If time is the issue, then CW usually wins over voice for formal text messages.
Unless you have special facilities like skilled stenographers and tape recorders.

Thought experiment: A message consisting of a list of 50 or so names and some
other text needs to be passed. You have a voice circuit and a CW circuit, decent
ops at both ends of both circuits, and they have to write down the message
with pencil and paper. Who do you think will pass the message faster?

Well, sooner or later you are going to have to renew your license.
When that happens, the effective date on you license is going to
be after the regulation change date. So in the end, you will be
"assimilated". You will become one with the collective.

The only ones who will continue to be distinguished from the Borg Extras,
like Jerry pointed out, are the ones with license classes that no
longer exist, like Advanced. And, it is likely that they will be
grandfathered, or is that "assimilated", in eventually.

I think I need to throw in a few happy faces. :) Everyone is starting
to take this thing way to seriously. :)

2499. RETEST every 10 years

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-23 16:14:45 UTC
From: rasw <atdot.dotat@at.sorry>
Message-ID: <a2mnhm$3j1ti$1@rn.area.com>
Source record: 32011

Even though I'm getting on in years myself, I think they should RETEST hames every 10 years or so for two reasons:

1. The UNAUDITED "VEC" system is not as reliable as when the government did the testing

2. Many older hams are suffering from senile dementia an/or effects of RF on the brain. (That's why some of the most "experienced" hams have the worst operating manners.

Thoughts?

2500. "Know Code" international's web site isn't working!

Not obvious at all. Ed sez the position is running at a deficit.

If the fundraiser does not raise at least as much money after expenses as
has been done in the past, it's not good business sense.

If the fundraiser's attitude angers and alienates the very people who have been
most forthcoming with funds in the past, it's not good business sense.

"Growing up" has nothing to do with it.

97.407 is pretty clear on which stations can participate in RACES
communications, and leave no wiggle-room regarding "intention".

1) A station certified by a civil defense organization.
2) An FCC-licensed RACES station.

If your station is not in one of those categories you can't check in,
and the RACES stations are specifically prohibited from communicating
with you.

Them's the rules.

With all kind wishes,

de Hans, K0HB

I thought you were kidding at first but then after seeing you ask this
in other places, I guess you weren't.

NCI = No-Code International - http://www.nocode.org/

Check it out. It's good entertainment. :)

There use to be KCI - Know-Code International, but I can't seem to
find them any more. They may be defunct.

Now, that could well be. There are some folks out there who are, indeed.
But
you have been quite successfull in making it clear that you sure aren't
one of them.
You're really a pitiful case, as noted here often before. You'll NEVER get
over the code,
try as you might. It will always be there to jab you in the butt, to goose
you
along over all life's little humps (and some pretty big ones, too). Have
fun.

Cheers.

Exactly. And the converse is true. We're still tested on CW and it
isn't very important to proper operation on phone or data. :)

] All true - but many people's typing skills are pretty slow.

Perhaps we should make typing a mandatory tested skill for ham radio. I
can do 60 wpm pretty reliably, how about you? :)

] > It is TIME that is usually the issue, not rumors.
]
] If time is the issue, then CW usually wins over voice for formal text
] messages.
] Unless you have special facilities like skilled stenographers and tape
] recorders.

That may be. Although since I can type at 60 WPM, I can almost keep up
with normal voice speed. There is very little slowing if I'm typing the
traffic as I receive it. As for CW as faster, that is only if the CW
stations can receive fast enough. I doubt if everyone was at 5 wpm if
it would be faster.

Chip, you seem to have wandered in at Chapter 48.

I, for one, did not see a lot of sense in code testing beyond 12wpm in the 70s but I took and passed my 20 for the FCC -- in a blizzard walking 17 miles uphill in both directions barefoot and all that crapola. And that was when where I lived you could take it only every 90 days.

Since wandering onto this newsgroup I have been accused of being an old-fart in my mid-50s, running a hazing ritual, participating in Wouff Houng ceremonies, child molestation, bestiality, and a few other things for the simple fact of having passed a code test. I know it sounds silly and it is but it has happened.

What happens, and you see it here, is that because of an initial reluctance to simply learn what is a mechanical skill right up there with Advanced Nintendo which one learns essentially the same way -- by doing it, gonads and self-justification coupled with large doses of self-deception start to happen. I call it Lifer Tech Syndrome.

The classic Lifer Tech is a member of both NCI and the ARRL and is probably petitioning QCWA for a medical exemption. They show up at Dayton like the face of doom and make semi-annual pilgimages to HP Maxim's grave. And they are resident geniuses in rules and regs, 160 meter gray line propagation, emergency comms, and pronounce learnedly upon 'modern digital techniques' without having a clue how duplex TTY works on a phone line. Anything to achieve some sense of equality without the code test.

So as you might expect, OTs get a little tired of it. And I have an ethical problem debating simply because there is little to debate and I am enabling self-destructive behavior. So I don't.

You are apparently trying to be rational in an irrational situation. As I have pointed out to Cecil, there is little or no payoff in being the only sane man in the asylum.

Dick, N&#65533;BK

Seems no one but me is willing to even acknowledge it - the CB-ization of the
ARS
has been under way for a LONG time now.

Judging from the lack of interest in the late restructuring, it would seem that
is must
be relatively complete by now.

Lots did, When you consider that most of the military
conversions were "home brew" jobs that often involved
as much work at homebrewing. The main componant
of the station that was bought was the receiver. Many more
transmitters were homebrewed than receivers, though some
built their own receives too. The "one box" concept was
still far in the future.

Certainly meets the criteria as set by Mr S. If it weren't for duct
tape, this would never work. Interesting project was making enough 1.2
gig antennae to start things off. One of my neighbors cobbled things
together using cut up coke can for the director and reflector rings.
Worked OK till birds landed on them and bent them out of shape. Use a
lot of old cordless phones for parts

>

I work for a fairly large computer company with offices in White Plains
and Armonk, NY. Currently I am supervising the installation of a 20,000
sq foot Class 10 clean room in their new chip manufacturing facility
being built in North Fishkill, NY. Normally I head up the ESD QC
division for the entire corporation. Once this project is done, I am
off to the next one. Normally I am in the Elmira plant (3 days a week)

(I have a cousin who lives there part time. As far as I

1) Some people had enough trouble passing the test the first time.
2) Retesting will include questions (just as the initial test did) on areas that some operators NEVER use. Not everyone is interested in ATV, satellite, packet/digital, HF, VHF/UHF-repeaters, etc.... There is no one common area to all operations.
3) If someone fails the retest, what do you propose? Immediate downgrade or license cancellation?

I have to correct that. I read that last year ended with the fund raising effort is about $100k ahead of the year before. The position was started as a deficit, but it appears the investment is being returned. That was the hope.

> If the fundraiser's attitude angers and alienates the very people
> who have been most forthcoming with funds in the past, it's not

Frankly, I am still amazed at Dave's reaction. I rather doubt that he believes that anything that was said in the donation letter is untrue. By what he told us, he has known for years the reasons that it takes $$$ to protect spectrum -- with increasing pressures, now more than ever. The fact that the letter is trying to say it a bit more forcefully to reach some of those who have not chosen to make contributions in the past (apparently iwht success) seems to really bother him. I don't understand why.

Most fundraising efforts do start out that way. Ya gotta spend money to raise money. The question is whether the efforts work in the end. As far as the expanded ARRL fundraising effort is concerned, the early results are encouraging.

> If the fundraiser does not raise at least as much money after expenses
> as has been done in the past, it's not good business sense.

Duh, really?

The first program the new fundraiser did (the Defense Fund drive) netted about $100k more than previous efforts. So far, so good.

> If the fundraiser's attitude angers and alienates the very people who
> have been most forthcoming with funds in the past, it's not good
> business sense.

As far as I can tell, Dave's complaints are (1) that the League has hired a professional to manage its fundraising and development efforts, and (2) that he got a fundraising form letter. As for (1), the reality is simply that the ad hoc fundraising ARRL has relied on in the past is no longer sufficient to meet the growing threats. With regard to (2), form letters do annoy some people, but they are an effective means of soliciting contributions. If someone knows of a better mechanism, I'm sure Mary Hobart, the ARRL Chief Development Officer, would like to hear about it. (So would every other nonprofit organization in the country!)

Anyone who's interested in more background can read the editorial in February QST, also available at:
http://www.arrl.org/news/features/2002/01/14/2/

KCI stands for Know Code International. NCI stands for No Code
International. KCI advocates the retention of code testing. It also has
said that if the code testing *was* removed, the written tests should be
strengthened. NCI advocates the ending of All code testing with no
strengthening of the written exams. It has also hinted that CW's (and
Digital's) special status should be removed so that all modes could fend for
themselves as it believes that no single mode should have special status.

I don't want to get into a "gun rights" debate here, but the abuses have
been in large by criminals who will not abide by any regulations concerning
registration (control); past, present, or future. We have seen this
internationally time after time (England, South Africa) There is no balance
as I see it. We have the right to bear arms, not to be infringed -- period.
Additional regulation will not help one bit.

Well, if you insist. From
http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=47&PART=97&SECTION
=313&YEAR=2000&TYPE=TEXT the following:

[Code of Federal Regulations]
[Title 47, Volume 5, Parts 80 to End]
[Revised as of October 1, 2000]
From the U.S. Government Printing Office via GPO Access
[CITE: 47CFR97.313]

[Page 597-598]

TITLE 47--TELECOMMUNICATION

COMMISSION (CONTINUED)

PART 97--AMATEUR RADIO SERVICE--Table of Contents

Subpart D--Technical Standards

Sec. 97.313 Transmitter power standards.

(a) An amateur station must use the minimum transmitter power
necessary to carry out the desired communications.

Now, if you'd like, I imagine that more can be found on the topic but I figure the FCC *is* the governing body of the ARS. The text specifically states, "an amateur station must use the minimum transmitter power necessary to carry out the desired communications." So, Jim, if only 25W is necessary, how far above the "minimum power necessary to carry out the desired communication" do *you* recommend?

My interpretation stands.

Kim W5TIT

Hans, if all the garbage that existed *before* I ever got into ham radio hasn't seen the demise of ham radio, you won't see it from me as an amateur either. Get real.

>

You absorb your time by watching shows like that? You'd probably do better by reading a little more, but that's just my opinion. Try the FCC website. Especially the part about minimum power standards.

Actually, I am going on break from public service. I have just resigned my position as Hunt County ARES EC--handing the reigns over to the very capable KD5DXW. I am rounding up mentoring my last class of ARECC, which I have been doing for just about a year steady now. I spent $1500 of my own money for an all day planning session in Hunt County, where local fire and county EOC and NWS were guest speakers. I am tired. I am worn out...and now my job requires much more time from me--which takes away from my capabilities for emergency and public service.

Yeah, what you been up to there, Jay? Eh?

I saw this while I checked the newsgroup from work today. I *was* going to recommend that you go back and read the posts from the fella named "Jay," to whom I began responding with the comments on tuning up and power limitations. However, I've discovered he's quite a boring read, so you may waste your time. I wasn't aware you may have come in mid-thread.

Jim, in an organization as large as the ARRL, for every person dismayed by
something the ARRL does, there are probably an equal--if not greater--number
of people that will take their place. If the fundraiser does her job, for
at least half the people who may be dismayed enough to go, there will be
double that amount she brings in.

Yep, the ARRL has grown up.

Nope. How 'bout this. I am a RACES station here in Kaufman County. I am also a RACES station in Hunt County. I cannot, by the rules set forth in Dallas County RACES, enter a RACES net in Dallas County. I am certified by a civil defense organization, by virtue of being a RACES station in two other counties. Dallas County RACES does not allow check-ins or participation by anyone not in *their* RACES program.

It is entirely their right to have such rules. However, at the beginning of each and every net (unless they've changed since the last time I listened, and they may have) the preamble states that it is by FCC Rules and Regulations that they cannot allow non-RACES or any other than a Dallas County RACES station onto their net (that is paraphrased). I can listen up for you and give it to you specifically if you'd like. So, they are right to make their own rules...I believe the FCC allows for that. However, they are wrong to blame their rules and policies on the FCC--it spreads misinformation in my opinion.

I'll use the minimum power *I* feel is necessary to do the job. The FCC
sez I can and I do and if that's 1500 watss...so be it. The FCC sez
it's OK so that must mean it's OK and anything you say to the contray is
dead on WRONG!!!!

If I am helping out and the reptr/packet cluster goes down,
I can be asked for help. The important point is that the ham
can be present...but need not be awake and in direct
operation 24 hours a day.

> > > >> >Most other modes allow for

> book
> while operating CW.

How long can you keep it up for. In the voice mode, I could be
sitting back and grabbing a few z'x and anyone else could be
listening. Likewise, the packet cluster...anyone could be reading

incoming messages and replying while the ham was relaxing, etc.

> (I used to do my homework during CW traffic nets -
> and I was an A student). I can't eat/drink and transmit on voice at

I think it is bunk. Has there been ANY such movement to now
use CW rather than other "clear" modes?

> > It is TIME that is usually
> > the issue, not rumors.
>

I don't see any logic in that possibility.

> Unless you have special facilities like skilled stenographers and tape

Let's be serious here, it will depend on each person. The vast majority of such traffic in none ham communications would be voice. If CW was any sustained and consistent clearcut winner then the military and all other services wouldn't have abondoned its use.

Cheers,
Bill K2UNK

HMMMM sez absolutely nothing about any quantitative amount of power.
Looks like the FCC leaves the decision up to the individual amateur
operator. Guess you lose again KIM!!!!

If I feel that 1500 watts is necessary then I am in complete and total
compliance and neither you nor Mr Bill DX Sole can state otherwise

> >
> > It is a subjective statement left to each

I have a copy in the shack just like you're suppose to and no where does
it say I can't use 1500 watts if that's what I think is needed.
Anything you say to the contrary is dead WRONG!!!!

You lose twice. care to a hat trick??

BTW your opinion don't mean merde when you're wrong

The police do this all the time. Odds are far more
likly someone of ill repute would be listening to police
via a scanner...than just happening on an emergency
QSO on the ham bands.

Me thinks thou doth grasp at straws.

Cheers,

Hmmm, I spent 2 weeks with the Red Cross between 9/14 and 10/1. I spent
3 weeks after that with the Salvation Army (and my company even paid me
for the time off) I got wear some great coveralls and got to keep the
nifty face mask that everyone downtown had to wear.

I am sure that the FCC, as a governing body, may *wish* that all amateurs would subscribe to and follow the goals set forth in Part 97. However, it's obvious they also recognized that as a fairly unrealistic wish, since they don't *require* all amateurs to subsribe to all parts, especially the Basis and Purpose.

Chip....FYI to a couple of your questions:

Mr. Stevenson is Carl Stevenson, NCI Exec. Director

NCI is: No Code International...a member based organization
whose charter is to end all morse code test requirements.

Mr. Stevenson does NOT work for the FCC...however, Carl
has also NOT said Kim or people that have similar mindsets
towards amateur radio have no place in amateur radio.

Cheers,
Bill K2UNK
NCI Director

In truth, no I don't. The words choosen for the Part 97.1 rules
are very clear that the FCC is setting the purpose/goals as being
for the service as a whole rather than expected of or
required of each individual ham. Might the FCC be particularly
satisfied if EVERY ham subscribed to and followed every aspect of
the goals/purpose? Sure, but IF they wanted that as a specific
approach, they would have stated it as such.

Cheers,
Bill K2UNK

> and it is but it has happened.
>

Dick, while I have never seen you act in the manner that has elicited the above responses from people--it is not the fact that people passed CW tests that caused them. First of all, it is people out of control on both sides that caused it to happen. But, the philosophical aside, the response that begets the comments about hazing, child molestation, bestiality, etc., are purely anger inspired comments at the very aggressive posturing on the part of over-zealous hams who riled against the Biennial Review (Restructuring).

As an example. I have no problem at all with someone making the immediate decision that another is a slough because they only passed 5wpm to get onto HF as a General. However, when that person--who thinks the other is a slough--begins calling names such as Extra-Lite; or making it sound like all of amateur radio is going to die because of the policies set forth by the FCC; or the debate takes on a life of its own because someone makes the stupid comment that "well, you must be as good at making it easy on yourself with welfare as you are at being lazy in ham radio" and countless other ridiculous analogies, then I have a real problem. The analogies are

unfounded and so is the namecalling and the attitude.

You are generalizing. And it's ridiculous that you allow yourself to get
caught up in the attitude you display, above. For you, it looks like it all
boils down to a CW test. Ignore the real contributions that many will make
to amateur radio.

While I suspect that's just being sarcastic, I'll attempt
to show why they did it the way they did.

The FCC set the basis and purpose as a defining aspect of
why the service exists. If, in the overall results of the
amateur service the basis and purpose isn't generally being met, then
the FCC might seriously question the future existence
of amateur radio (IMHO).

Cheers,

Well, I don't see a problem with that at all. However, I hope your emphasis on the word "I" is not meant to indicate a defiance of the FCC R&R. I could decide arbitrarily that I just absolutely need a full 1500W to contact a station. The reality of that is probably quite false.

Your technique of debate sounds rather like some of the poorer ham operators and CBers that I've heard. Do you happen to have a ham license?

Me thinks you know little about police radio operations, or your local PD is a bunch of clods.
The proper way to handle sensitive police comms is by secure methods if that means finding a hardwired phone. Today, digital cellphones take care of it.

I and others (Gary was one, I believe, but there were others, too) have stated taht clueless idiots who know virtually nothing about radio, don't care to learn, and don't give a damn about anything but operating appliances to play infantile/machismo competitive games that simply happen to use the radio medium as a playing field are NOT really living up to the chartered purpose for our service and would be more appropriately hosted in one of the non-technical personal radio services like CB, FRS, etc.

Hmmm reads like he did say that stuff...I continue (oh BTW, all this took about 3 minutes to find....

From: Carl R. Stevenson (wa6vse@fast.net)

I agree, Steve ... ham *radio* is supposed to be about *radio* ... technology, experimentation, public service communications, etc.

Many, many existing hams who simply want to use radio as a medium to yack and play infantile competitive games really belong in another, non-technical personal radio service like CB, FRS, etc.

Simply because 1) it's necessary to demonstrate that you know enough to operate safely and in compliance with the rules ... and 2) because ham radio is *supposed* to be a TECHNICAL avocation ... it is meant for those who want to tinker, build, experiment, and learn ... NOT just to be another personal radio service for folks who don't give a shit about radio technology ... the ARRL has promoted the competitive games and DXing thing to the point where they have perverted ham radio into something VERY different than its charter purpose ... if we don't get it back on track, we'll be dead meat before 2010 ... many of us don't want to see that happen because of clinging to "tradition" and religious dogma WRT the mystical powers of Morse ...

> when all I want to do is plug in my Yaesu, connect it to a store bought
> antenna and yell CQ DX? Why not just stand at the local Ham radio outlet
> and hand licenses out?

Because it's not CB ... despite the fact that many of you act like it
...
you sound like you really belong more in one of the personal radio
services like CB, GMRS, or FRS ... they are not technical and don't
require any technical knowledge ... they are specifically for
"yackers" ...

Hmmm sounds a lot like 5'6 300 pound kim svelte as she may be

Gee Bill, seems like Carl actually did state the very things you deny he
states such a suck up.

Actually it's a perfect debating style. Your opponent makes a
categorical statement and then in rebuttal you prove the statement to be
credibly false. There is no defiance in any R&R's because the R&R's
don't set down definitive terms. *I* feel that to work last weeks VP*
I needed 800 watts minimum, so I cranked the amp to 800 watts
(approx). I want to work Bill in NJ, being in NY *I* need 50 watts, so
I reduce my power. It's up to *I* to determine the minimum power needed
and the FCC backs my decision. The reality of the statement is
absolutely true

And yes I do. I chose to share that with friends family and other
amateur contacts I make on the air, not via some the Internet. I will
give you a clue, there are 4 letters in my call and there is the number

2...knock yourself out rolling on the floor laughing your ass off...must be some sight, all the pictures swaying, the vases rattling around yada yada yada

CW is secure as far as the general population of "scanner manners" and
"Hobby cops" is concerned. That is the target population.
Hey, if you have a no-code tech ticket that would include you and the rest
too,
niche war? Besides, with all those Crays out there, what *is* truly
secure?

How do you nocode dudes ID the local repeater?

>That may be.

It is. What slows down voice transmission of record messages is not only the
writing/typing speed at the receiving end but the necessity to phoneticize
unusual words.

> Although since I can type at 60 WPM, I can almost keep up
>with normal voice speed.

Until you hit something that must be spelled out, like an unfamiliar proper
name.
On CW it's already spelled out.

>There is very little slowing if I'm typing the
>traffic as I receive it. As for CW as faster, that is only if the CW

>stations can receive fast enough. I doubt if everyone was at 5 wpm if
>it would be faster.

5 wpm is th starting point. With a little practice most folks can get up to
20-25 wpm fairly quickly. We're talking ablout operators with decent skills - neither
beginners nor experts.

True. But technical stuff is basic to the basis and purpose of the ARS. The
attitude of "I don't care about technical stuff" reduces the justification for
the existence of the amateur radio service.

There is no excuse today for dumping a signal on the air to "tune up"
an xcvr, amp or transmitter tube or solid state types. Those tuneups
can and should be done into a dummy load - which costs what?? A lousy
thirty bucks for a kilowatt version?
>
>
Proper 2002 operating practice is to "tune up" antennas with one of
the inexpensive antenna analyzers which are out there now and an
antenna tuner, not by putting a dead carrier on the air and diddling
the pi net tanks in boat anchor transmitters and/or tube-type amps to
"fix" high swrs an antenna might present.

>
>Then I just don't understand your point.

My point is that testing is not a perfect indicator of something's
importance to amateur radio. I thought you'd agree with that
statement.

For example, I think it's important for ALL hams to know the
standard phonetic alphabet (alfa, bravo, charlie...) well enough
that they don't stumble or make up nonstandard ones because they
can't remember the standard ones. Is that tested? Nope.

I also think hams should know Ohm's Law for DC and its practical
applications well enough to avoid stuff like trying to power a 50
watt rig through 30 feet of #20 wire from a 12 volt battery. That's
not well tested, either - one can get all the Ohm's Law questions
wrong and still get an Extra.
well

>What do you want
>to see happen related to any of those skills?

Hams should be of a mindset to learn them on their own. Just my
opinion and example. I'm not on phone very much but I can do
the phonetics.

I don't.

> Has there been ANY such movement to now
>use CW rather than other "clear" modes?

I don't know. Note that CW is not the only option - modes like
PSK31 serve the same purpose, and are mentioned above.

The fact that something isn't done widely right now doesn't
mean it's a bad idea.

>> > It is TIME that is usually
>> > the issue, not rumors.
>>
>> If time is the issue, then CW usually wins over voice for formal text
>> messages.

>
>I don't see any logic in that possibility.

If you have to send a written message, CW with decent operators is
usually FASTER than voice because the voice ops have to spell out
and phoneticize. Being able to talk 200 wpm doesn't help if the
receiving op can only write at 25 wpm.
>
>> Unless you have special facilities like skilled stenographers and tape
>> recorders.
>
>What is so special about a tape recorder?
>
Cecil cited a case where they sent simulated messages by voice at high speed
and then played them back for a professional stenographer to transcribe. Do all
the emergency stations you know have tape recorders set up like that?

>> Thought experiment: A message consisting of a list of 50 or so names

>
>Let's be serious here, it will depend on each person.

Sure. That's why I specified "decent ops - not beginners and not experts.

>The vast majority
>of such traffic in none ham communications would be voice.

It would? Why not use a data mode?

>If CW
>was any sustained and consistent clearcut winner then the military
>and all other services wouldn't have abondoned its use.

Not that old saw!

The reason the military/commercial services stopped using Morse/CW was
to eliminate the need to train and PAY skilled operators. They installed TOR
type modes as a replacement, not voice, in almost all cases.

Since hams are unpaid and self-trained, we have a different paradigm.

How much SSB and FM do the military and commercial services use?

It sure sounds to me like you are very resistant to the idea that Morse/CW
has, or can have, any place in amateur emergency communications, Bill.

> "Tuner upper" carrier = LID.

I know a guy who has an older-model Kenwood rig - top of the line some
years back. Has the built in ATU and nice filters, really good deal for
just over a thousand bucks. The ATU cannot be manually adjusted by means
of an external noise bridge or analyzer - it's part of the rig.

Hooked to a G5RV, it does a decent job. The ATU deals with the moderate
SWR of the G5RV. Nice setup - find a clear spot, punch the tune button
and the servos grind away until a match is found.

Of course a carrier goes out while this is being done, and the guy always
IDs afterwards.

Is he a lid?

2594. The Mother of all Radiosport Contests

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-24 15:25:44 UTC
From: K0HB <K0HB@arrl.net>
Message-ID: <eurQatOpBHA.1440@cpimsnntpa03>
Source record: 32105

N0FP posted an idea to the CQ-CONTEST reflector a couple of days ago about a contest that could prove to provide considerable exposure to contesting, ham radio, and emergency preparedness.

The purpose? To demonstrate that US hams are capable of originating and delivering significant and meaningful traffic to central collection points. We are not rank "amateurs".

Imagine a contest where the purpose is to publicly simulate a significant national disaster--a thermo nuclear device detonated over Chicago for example. The FCCs Mr. Powell would send out a press release to the ARRL and all media (CNN, NBC, ABC, etc.) at high noon EST on a Friday or Saturday between two dates (e.g. 9/11 and 3/31) stating: "All amateur radio operators are instructed to begin the emergency communications simulation beginning today at 02:00 UTC and ending 06:00 UTC. That would be the kick-off of the mother of all US contests. All amateurs on all bands on all modes all at once. Every scrap of equipment you own would be pressed into service.

Starting at 22:00 hours the same day, W1AW would begin posting instructions for the contest using digital modes to provide the "rules of engagement" for the contest. The contest exchange, log routing, collection points, etc., would be sent from W1AW during the entire contest. Specific instructions from W1AW will direct appropriate band limits, restrictions, regional information, etc.

The goal for contesters would be to collect valid QSOs using the instructed exchange. Any station may be worked for valid QSO points, on any non-WARC band more than once, but never more than once per hour. All US amateur ops on all bands except the WARC bands would be eligible to collect valid Qs. Each US section would be a "team." Logs would be routed to section managers using ARES people to man the traffic. The traffic would be the logs of contesters.

The goal? Deliver logs to section managers as often and quickly as possible. Points would be assigned to sections based on the number of Qs in the log and the time received by the section manager. Relays of logs are encouraged. The use of VHF frequencies is encouraged. Every scrap of equipment you own will be pressed into service, except your phone line. No internet is allowed. No twisted pairs allowed. Only RF delivered traffic allowed.

Section managers will accumulate the data and summarize the results. Email the results to a central collection point -- W1AW. Mr. Powell will get a report on Monday morning outlining the success of the operation. Number of Qs, counties covered, time delivered, number of stations, etc. would all be

proudly displayed to the FCC and the media. We are not rank "amateurs" as some congressmen have proclaimed recently.

This is rough but I think you get the general idea.

*****

Imagine the press. Imagine the questions you will get at work. Imagine the pride in Mr. Haynie's heart when he delivers the 6" thick printout to Mr. Powell, in a ceremony on the following Monday morning. Congressmen will no longer be able to call us rank "amateurs" any more. I wonder if the BoD will question whether these line scores should make it into print? Contesting will be front page news on QST for sure. Page 2 on NYTimes, Wall Street Journal, CNN Headline news and on-and on-and on.

Imagine the local press in your neighborhood anxious to get the local scoop on this mysterious press release the previous Friday noon. Equipment sales will soar. Contesters will be asked to Elmer the capable hams that have shun contesting all these years. I get goose bumps.

You want to contribute. Give this idea legs and the ranks of ham radio, and contesting, will grow more than at any other time in our history. The only way this will fly is if contesters get involved. The time is ripe (9/11). Real traffic in a real emergency simulation.

Then you haven't been paying attention. Here are just a few
quotes on the topic from Carl.

With all kind wishes,

de Hans, K0HB

PS: I have some sypathy for his position.

".... he's not a "real" ham in the sense of what ham radio is
supposed to be and perhaps he is more suited to a "communicator"
service like CB or GMRS or the new FRS (family radio service) ... those
three services exist for the many people who wish to "yack" on the radio
without having any technical skills or interests ... that's NOT what ham
radio is for ..."

"Because it's not CB ... despite the fact that many of you act like it ...
you sound like you really belong more in one of the personal radio
services like CB, GMRS, or FRS ... they are not technical and don't
require any technical knowledge ... they are specifically for "yackers" ..."

"Simply because 1) it's necessary to demonstrate that you know enough
to operate safely and in compliance with the rules ... and 2) because
ham radio is *supposed* to be a TECHNICAL avocation ... it is meant
for those who want to tinker, build, experiment, and learn ... NOT just
to be another personal radio service for folks who don't give a shit
about radio technology ... "

"I agree, Steve ... ham *radio* is supposed to be about *radio* ...
technology, experimentation, public service communications, etc.

Many, many existing hams who simply want to use radio as a
medium to yack and play infantile competitive games really belong
in another, non-technical personal radio service like CB, FRS, etc."

"I and others (Gary was one, I believe, but there were others, too) have
stated taht clueless idiots who know virtually nothing about radio,
don't care to learn, and don't give a damn about anything but operating
appliances to play infantile/machismo competitive games that simply

happen to use the radio medium as a playing field are NOT really living up to the chartered purpose for our service and would be more appropriately hosted in one of the non-technical personal radio services like CB, FRS, etc."

As much as I enjoy using Morse, the above is simply not true. The military abandoned Morse because it is simply impossible to run a modern war in a multi-threat environment at 25WPM.

Been there, tried that, it didn't work.

Where are you going to find a dummy load to exactly equal an antenna system
with an unknown load impedance? Take 300+j300, for instance.

It was just as true in 1940. The signal Corps was run by two guys one
from RCA Globecom and the other from Western Union. Large amounts of TTY
was installed asappy for exactly the reason Hans mentions.

Not that my opinion matters much, but, I wouldn't consider this person
a lid. He has done everything he could to ensure that no one is being
interferred with. And, in the end, he IDs himself. Sounds like careful
considerate operating to me.

But then, I feel this way partially because that's how I operate. Just
without the ATU. I have a dummy load and use it for gross transmitter
adjustments but you always have to do some little touching up, if you
change frequency very far. For some reason my antennas don't have the
bandwidth that the dummy load does. :)

If I move a appreciable distance, I find a clear spot, listen for a
while, and then do about 10 seconds of tune-up. If I'm going to send
a CQ, I usually stay right there and work that frequency. But if I
really intend to work someone else, I move to his frequency. My TX
and RX frequencies are independent of each other. There is no need
to re-tune if I don't have to change frequency very far. (How many
out there how to use a "SPOT" function these days?)

My main rig runs full-breakin and I can hear the band while I am
sending. This is a great feature and helps save some time, should
you accidentially get on someone elses frequency (and accidents do
happen). Or, when the band goes out in the middle of your transmission
and the other station starts to send.

The ones that get me are the ones that tune up right on top of your
signal, while you are sending a CQ. I'm running full-breakin and I
can hear them. It's most distracting. Or, on someone elses CQ, while

you are trying to pick them out of the noise. I guess everyone has their pet peeves.

Well, so much for my random thoughts. Just putting in my $0.02. Thanks for reading.

Can you provide the list of licensed individuals who are exempt? The point is that the Basis and Purpose stated in Part 97 applies to ALL amateur radio operators.

> Might the FCC be particularly
> satisfied if EVERY ham subscribed to and followed every aspect of
> the goals/purpose?

Minimum reasonable expectation should be that every licensee would at least be aware and supportive of the Basis and Purpose. Nobody is saying they HAVE to fulfill every aspect of Part 97. But it's quite another thing to stand in defiance of it, claiming "I don't have to, you can't make me".

With one notable exception. The US Coast Guard generally doesn't operate in a multi-threat war environment. They opted out of CW for purely financial reasons as did most commercially based CW stations. And, of course, the military still uses and trains Morse operators for Special Operations. That hasn't gone away, and won't for a long time to come.

I never could understand that reasoning, Kim. I think that's why ARES has a
huge advantage over the RACES program.

Hey dumb fuck..... CSCE is sitting right at home for your ever-important code test! Don't have the need to send it in nor the equipment as well. My dead ass as you call it works between 55-70 hours per week as well as pursuing university courses? So who has the dead ass here? At least I either to try to support others here or inject a little humor once in a while. I earned my license, and the CSCE for both the General written and the code test.

Oh yeah.... had it not been for some VE's screwing up 13 years ago, I would have been a licensee then. They chose what rules they wished to follow, and made up their own.

Get a life loser.

Get a clue! All USCG (seagoing and airborne) units are configured and
trained to operate as an integrated part of US and NATO naval forces
in time of conflict, and CW would be as obsolete as sails in that
environment.
Has zero to do with "financial reasons". Has entirely to do with mission
critical communications capabilities.

When the Coast Guard removed CW monitoring stations, they cited (the cost of
training operators) as one of their reasons for discontinuing use.

Hans, you certainly are quick to tell people to "get a clue". I suppose
that being a MCPO and drinking that retched coffee for all those years can
do those things to ya. : -))

It rarely is of that much immediate concern.
You are far more likly to have several people who
can type at 20 wpm than CW operators at that speed.

Hams don't have to be present at all for packet cluster
operations where traffic is being received or automatically
passed through. As to being awake...do you really think the
FCC would object if a ham was sitting near a voice
station grabbing a few ZZ's while other (non-ham) emergency
volunteers were talking on the station? I really doubt it.

>
> Not that old saw!

The truth, like it or not.

> The reason the military/commercial services stopped using Morse/CW was
> to eliminate the need to train and PAY skilled operators. They installed
TOR
> type modes as a replacement, not voice, in almost all cases.

I'd agree to the "commercial" economics, but
if CW was truly better, the military wouldn't care about
the costs. We are not talking about megabucks here.

> Since hams are unpaid and self-trained, we have a different paradigm.

True, and if YOU wnat to do CW, then go for it. On the same
basis, I don't propose its use for emergencies.

> How much SSB and FM do the military and commercial services use?

Probably a lot of FM these days.

> It sure sounds to me like you are very resistant to the idea that Morse/CW
> has, or can have, any place in amateur emergency communications, Bill.

You are free to propose its use. I don't.

Quite frankly, all I saw in that post was Carl Stevenson's expression of dismay about poor operators (I don't like to say CBers, because I also like CB) on ham radio. While he may find my not-so-technical attitude toward ham radio not to his liking, that is certainly his right. I think he gets a little on the side of name-calling, but isn't that what you've been doing also? Isn't it what most of us do best here, when our ire is up?

So?

Sounds like Carl has an idea of how he thinks ham radio should be. While I
would disagree with his sentiment that someone may be more suited to
something like CB, etc., I do find it interesting that he did so in the
above post without really insulting comments.

>
> "Because it's not CB ... despite the fact that many of you act like it ...

If this was a comment to "new" hams, I'd be concerned that Carl hasn't
listened around, even 6-7 years ago. There's loads of "stuff" I wouldn't at
first expect to hear on ham radio. Of course, I like yacking.

>
> "Simply because 1) it's necessary to demonstrate that you know enough

I wonder if Carl's attitude has changed any in the recent past. I'd challenge him on this one. Ham radio is something for everyone, technical or not, technology or not.

>
> "I agree, Steve ... ham *radio* is supposed to be about *radio* ...

I'd agree with this. But I'd allow for the potential that there are people who won't be interested in any of the above, and that is OK, too.

>

>

Well, I don't operate an appliance to play infantile/machismo competitive games. I think Carl is right on the money. If there are people who are picking up ham radio to act as such, then they'd probably do better to get onto CB and do it.

If the FCC wants to put meat into the Basis and Purpose, then it will have more meaning. It's kind of like gentlemen's agreements. I don't believe in them. I wasn't around when those agreements were made, and I don't agree with them. I will abide by them--but they'll never have my endearment. *If* it's just a mention, that's all the regard it gets...the Basis and Purpose went out with the bathwater quite some time ago. I think it's only brought up in argument, just as most FCC R&R are brought up.

Don't take up writing rules/regs or contracts because you
are having difficulty in uderstanding the difference between
mandating vs a general expectation of the service at large.

> > Might the FCC be particularly
> > satisfied if EVERY ham subscribed to and followed every aspect of

Has the FCC every tried to "make anyone." With all the actual
offenses that the FCC has prosecuted, has there ever been
anyone charged for NOT following the basis and purpose?
The basis and purpose items are "goals" and they are certainly
not in any way definitive in making a claim of "non-compliance."

Cheers,
Bill K2UNK

Nope, sorry to shock ya there, Jim. Each time I've been on the air on HF with this callsign (twice), it's been a matter of just a few minutes and I've had a pileup on me. Both times I was the one getting off the air while there were still all kinds of calls out there.

Sorry. But that's the way it was. And, as soon as I do my own QSL card up (I've always done others' but never got to my own...LOL), I'll be back out there. That is when I'll probably log, so I can run the cards out to whomever they'd go to. I am sure they think they're going to get some kind of XXX-rated card, but they won't. Wolves are my favorite animal, and that's what my card will be. Part of a wolf's face, with the reflection of Texas in his eye. I just have to figure out exactly how to do it in black and white and have it look really great.

What about the "other people" you mention Bill. I can't believe someone who professes intelligence ever tries this weak ploy to evade the fact you got GOT!!!

At times you amaze even me with your total lack of following your own threads.

As to Kim fitting the Carl slacker profile, there's this gem.....

Well, Hans, I've never made a secret of my belief that I put forth little effort for ham radio. My pleasure in ham radio is simply picking up something that is already put together, with a working microphone attached, and talking.....I have never really professed to be any more than an "appliance operator."

(a perfect example of Carl's rant about a person who is better off on FRS or CB but not on amateur radio.)

So that's 2 for 2 on the ooppps I did it again. You must have been a debate teams nightmare when you got up and spoke.

Of course you can spin this any way you want..after all your ARE a politician and that's what they do best..

Does Carl pay you money to be his punching bag or do you do it out of a total sense of loyalty to someone who has no use for anyone but those who see his point. Come on Bill, even you don;t fit the CS world of amateur perfection. You have yet to even work one public service event in your local calling region..admit it
Thanks again for trying. Maybe you should buy Debating for Dummies. It will help you at least formulate a better response than what you present here.

Sorry dud err dude, that's a fact jack!!!!

You take one statement out of the context and ignor Kim's
public service, etc. That has been your problem all along,
you micro analyze and miss the big picture.

> So that's 2 for 2 on the ooppps I did it again. You must have been a

Gee, we seem to have a problem Bill. You state fact, get caught with
erroneous information then back pedal..typical Kim fits the CS profile
for a person who according to CS is not fit to have an amateur license.
Period..end of sentence. Deal with it.

I know you are legendary of discussing you public service exploits at
the local NNJ hamfests. As if walking around with an HT is public
service. Yet, no mention is ever made of the various walk-a-thons,
marathons, civil events, etc etc Sorry, you are well known in the
circles that you travel. Hey, come to think of it, I got a mailing
about the SARA hamfest in a month. Will you be there giving a talk on
all the great public service stuff you do. Remember, old stuff doesn't
count. It's what you are doing today that makes the grade (D-)

The people I want to know, know. Those that are on a need to know basis
are..well...left out. Care to wager where you fit. Funny how you never
seem to give that Aaron guy a line like that....hmmmm..come to think of
it...UNK and Aaron always post within a few minutes of each other...then
Aaron disappears..hmmmmm

>
> >and Sorry dud err dude, that's a fact jack!!!!
>
> Just another example of why you apparently hide who
> you are.

I love it when you are baffled. Keep smiling Bill You are a great
humanitarian. After all, you spent all that time and effort making sure

that people can ride around with scanners in NJ. BTW, what was your role in the recent NJ decision to allow amateur radio license plates. I don't remember seeing your name anywhere on all the reports. Aren't you an ARRL Government Liaison? Isn't that what you're suppose to be doing?

>
> No cheers,
> Bill K2UNK

No Cheers, where everyone DOESN'T know your name get it Bill.. You made a funny

TTFN I am off to the land of sun and snow The lovely Mount of Stowe for 2 weeks of skiing, wine and wenching. Feel free to discuss me behind my back..that would fit the typical politician profile

If a compromise it be. What I think will come of this is that we will
have a lot of guys who will need to unlearn a lot of bad habits to get the
the journeyman 16-20 level after they have been subjected to 5.

You're mistaken on that point. I said Part 97 applies to all amateurs,
and you've been trying to shoot me down on that point.

You misunderstand. We're seeing that kind of attitude conveyed by some
here - in particular, those arguing from your perspective.

Wow. So you're pretty experienced in this. We were talking DX
pile-ups. You've been on the receiving end of a DX pile-up have you?

How can an amp with adjustable pi-net tuning be tuned up into a mismatched
load without putting a carrier on the air?

Hans,

Thanks for posting this.

There are some details I would haggle over (length of contest, for example) but they are just details. The basic concept is excellent. It's long overdue.

Does ARRL Hq know about this?

Simple:

You need three pieces of extra equipment:

- MFJ-259B analyzer or equivalent
- dummy load capable of handling the amplifier power output
- transmatch capable of handling the amplifier power output

1) Measure the "mismatched load impedance" with the analyzer.
2) Connect the transmatch to the dummy load and the analyzer to
the transmatch.
3) Adjust the transmatch until the analyzer says it's the same impedance
as the "mismatched load".
4) Disconnect the analyzer from the transmatch and connect the amplifier
output
5) Adjust the amplifer for desired output into the transmatch/dummy load combo
6) Disconnect the amplifier from the transmatch/dummy load and connect the
amp to the "mismatched load" .

Repeat this 6-step process for any significant frequency change.

You only quoted the milder ones. Look up "electronic paintball wars" "dinosaur
dung encrusted regulations" "no setasides for legacy modes" and some other
gems. The quoted posts only skim the surface.

The real kicker for me was the "simulated HF" system he proposed. As if!

Now of course some folks will argue that Mr. S doesn't mean what we know he
means, but his attitude comes through pretty clearly.

The most surreal part of all this is that Mr. S comes back to rrap bragging
about
his license test scores (competitive game - the tests are pass/fail) and
country
total (no mention of mode, though). All worked with appliances - no homebrew.
Maybe he's changed - who knows?

Yeah, but if you read the ISP-wireless reflector, even the Part 15 guys are creaming each other left and right. Somehow, some SS users don't realize that even a respectable 30 dB of process gain (loosly translate: interference rejection) doesn't compare to > 80 dB of off-channel rejection in a narrowband system. SS works well if all the other signals, SS and narrowband, are at approximately the same signal level. Even FHSS is not a panacea.

>
>
Ya don't tune out an 8.5 swr like that with the output network of the
transmitter - assuming the specific output network can do that. Ya
tune into an r5ï¿½+jï¿½ dummy load for at least two good reasons: Ham
transmitter output circuits are designed for optimum performance
assuming a 50 ohm resistive load. By "optimum performance" I mean
harmonic suppression in all cases and stability in some cases. Second,
a lo-pass filter simply won't do it's job if it's in a line with an
8.5 swr. Or if yer running any power and/or using one of the low-power
lo-pass filters ya toast it if ya have an 8.5 swr. So common-sense
good operating practice dictates that ya tune the transmitter into a
dummy load.
>
>
Then ya transform the r3ï¿½ï¿½+j3ï¿½ï¿½ antenna input impedance into a proper
r5ï¿½+jï¿½ impedance with an antenna tuner and bingo the swr is 1:1 and
the antenna is optimally matched to the transmitter. By using an
antenna analyzer, not by dumping the transmitter on the air to tweak
the tuner with an swr bridge.

Yeah. If his stupid MFJ antenna tuner hadn't crapped out he'd have
matched the g5rv to the radio with the antenna analyzer he had with
him and would not have gone anywhere near the ATU in his 940 and it's
tuner-upper signal. In fact that was the first time he ever used the
ATU, he had to dive into the manual to find out how to bring it up.
Heat of the moment thing, everybody is a lid once in awhile.

There is no external transmatch. The pi-net tuner is built into the amp.

I have never owned a high power antenna tuner. Without an external
antenna tuner between the amp and the antenna system, how do you
tune the amp's adjustable pi-net output curcuit without putting a
signal on the air? Use 100+j100 if that makes you more comfortable.

I think the idea can be the basis for an interesting exercise. From another venue, below are some remarks by N0AX.

With all kind wishes,

de Hans, K0HB

----- Original Message -----
From: "Silver Ward" <hwardsil1@mindspring.com>
To: <cq-contest@contesting.com>

Contesting today is in a pretty narrow groove (or rut). It's a very high speed game of electronic tag with a number of variants of degree and not in nature.

N0FP's proposal regarding data transfer is an interesting proposal. Imagine a contest in which data files are passed from station to station, adding the relay history as it goes. You would get points for accurate relays, number of relays, amount of data relayed without error, and for the length of the error-free relay chains in which you participated. A path-dependent score is certainly a new concept - prototyped by the WAE QTC and the Internet Sprint which passes along names. A whole new set of strategy and technical variables come into play. I can imagine the resulting efforts to optimize data transfer prototocols for radio, much as today we try to optimize our CW and phone copying accuracy and pileup handling techniques.

The modern scenario of having a national official start the game and receive the results is not at all new. The first official transcontinental relay tests in January 1921 featured message exchanges between the Mayors of Portland, ME and Portland, OR, for example. ("200 Meters and Down" - p. 65)

Contesting was born of training and technical exercises. What such opportunities are there for us today?

2676. Brand new stuff at www.ab7sl.com

Newsgroup: rec.radio.amateur.policy
Date: 2002-01-25 17:05:42 UTC
From: Charles Johnston <ctj92@cableone.net>
Message-ID: <3c519073@news.bnb-lp.com>
Source record: 32185
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

Some new stuff has been added at www.ab7sl.com in the past few weeks....

1. Site search - the entire site is now indexed and searchable from the
homepage

2. Arizona Repeaters Page - covering all repeaters statewide
on ALL bands. Sorted by county,band and frequency.
This added some 20 pages to the site.....

3. Weather Page - shows temps for selected US cities , full weather
conditions
for Prescott,AZ and USA - World weather maps and forecasts...

4. Added a Grand Kids Photos page....they are so cute and adorable!

> stage to an antenna - it ain't got no tuning knobs! Whatta stupid
> radio . .

He kept telling me I oughta buy one. Or something like it. Far as I
know ALL
of the rigs made with ATUs work that way. No way to tune the ATU
without
putting a signal on the air.

> > Hooked to a G5RV, it does a decent job. The ATU deals with the moderate
> > SWR of the G5RV. Nice setup - find a clear spot, punch the tune button
> > and the servos grind away until a match is found.

> Horsepucky.

That's exactly how it works. It's how they all work. Some are smarter
than others in that they "remember" the settings afor the various
bands and start
there to reduce tune time.

> The servos found the sweet spot in how many milliseconds?

Several thousand.

> Didja pay any attention to the power output meter during that process?

Yeah - it went up and down. Put quite a few watts out while tuning -
something's gotta drive the SWR sensors.
> >
> > Of course a carrier goes out while this is being done, and the guy always
> > IDs afterwards.
> >
> Last I heard he sed he'd ID his 940 tuner-upper signal as soon as some
> K2 owner in that neighborhood ID's after he kerchunks some .195
> machine . .

The Elecraft K2's ATU tunes very fast (<3 sec for most loads),
remembers the
settings and reduces power to 3W during tuneup. No servomotors,
either.

> > Is he a lid?

> Yeah. If his stupid MFJ antenna tuner hadn't crapped out he'd have
> matched the g5rv to the radio with the antenna analyzer he had with
> him and would not have gone anywhere near the ATU in his 940 and it's
> tuner-upper signal.

The analyzer costs how much and was made by whom?

Did the ATU work on all bands or was a manual tuner needed on one or
more? I
hear some ATUs have very limited range.

> In fact that was the first time he ever used the
> ATU, he had to dive into the manual to find out how to bring it up.

I think perhaps we are talking about two different people.

> Heat of the moment thing, everybody is a lid once in awhile.

I don't think it was a lid thing to do at all. Tuning up is allowed by
the
rules as long as you don't cause QRM in the process.

Well, first I must say congratulations to you for getting past
those tests. I have been through all of the tests and I know how
hard it is to fit in between work and school.

But, I don't understand the part about "sending it in". I thought
that all this stuff was taken care of by the testing station?
Well, at least mine was. I just paid my money, took the tests,
and then went home and waited for the license to show up.

Have they changed how this is done or is it done differently
depending on where you test?

If you do need to submit these things yourself, I would recomend
that you do it as quick as you can. I know that your time is tight
and you really don't have the equipment to use your new
privelages, but, a CSCE is only good for 1 year from date of issue.
Since your not losing any privelages, like some of the old license
classes did, it only makes sense to get it in the works. The FCC
is going to take their time with it anyway.

Well, just a thought. Congratulations again

Unfortunately, they don't stop at the 28 MHZ line. Listen to 28.085 and
28.115 AM. We've
got truckers up there complete with their stupid echos, squeaks, beeps and
other infantile noises
as well. We need to concentrate on getting those intruders out of there
instead of worrying about the so-called "freeband". If the lawful users of
that area below 28 MHZ want 'em out,
they'll holler about it. We need to protect our OWN turf! When you are out
on the interstate,
carry your camera/vid cam, or tape recorder and note book. Monitor the
lower portion of 10
meters and, if you spot a trucker a-beepin' an' a-squeakin' on 10 meters,
just take his 'pitcher'
and tag #, and send it to Riley. Get a recording of his activities. Do NOT
talk to the trucker--do not even let him know what you are doing, just
photograph, record and document and send it in.

Actually, I am asking how I could have tuned my AZ station, which included an HW-201, without putting a carrier on the air. The pi-net in the HW-201 had to be tuned for the existing conditions which was not 50 ohms.

My present amp is an SGC-500 which has a fixed 50 ohm output and works into SWR's up to 6:1.

You can't tune an amp without putting a carrier through it, obviously.
I think the output network in most amps is mainly designed to match the
output section to 50 ohms over the bandwidth of the amp. It's not
necessarily supposed to be able to tune to a wide range of load
impedences. That's what a tuner is for. Or you could go to:

Well, I was going to give your website address, but Yahoo/GeoCities is
playing some funny tricks with your website.

There's a fine description of a 50 ohm multiband dipole there. With
that antenna (and no tuner), you could tune your amp into a dummy load,
without putting a carrier on the air.

I tune my antenna tuner so that the load is 50 ohms with the MFJ
analyzer, tune up the amp into a dummy load, and I'm ready to go on the
air. I'll perhaps make fine adjustments while I'm operating.

> My present amp is an SGC-500 which has a fixed 50 ohm output and works
> into SWR's up to 6:1.

It's either got a real forgiving output section, or it has one of their
autotuners in it. I've got an Amplifier Reasearch 200 watt amp here.
It doesn't care what load impedence it operates into. But the thing
weighs a pound per watt.

>Do you think anyone really minds being being on the receiving end of a
>pile-up?

It is quite a bit of fun, at least if the pileup is a small one. But I can say that some of the pileups I have heard where stations just keep sending their call whether the station is working someone else or not would really not be an enjoyable experience for me.

Of course, I would solve the problem by working every one of them, and not entering the QSO in the log. :-)

Now, smaller pileups are a fun thing. I have run them from W1AW, on the CW county hunters net (14.0565 MHz) and, for some real fun, as the QRP Fox in some of the QRP foxhunts. A real blast!

I guess the point I was trying to make is that DX pile-ups are not
necessarily bad for international good will. I think that if I was a DX
station, it would be exciting to get on the air and have so many
stations wanting to exchange QSL's. In fact, the Dxpeditions depend on
that activity, and are disappointed when it doesn't work out that way.

Part 97 was written to regulate the Amateur Service. It is directed
toward everyone in the amateur service. There are not any certain
particular individuals within the service for whom it does not apply.
It is inclusive of all amateurs. Neither Part 97, nor I, claims that
everyone must build a radio. But what it does say applies to everyone.

Does Part 97 say you must? No, but it does give the impression that it
would be a good thing for you to do. Do you feel you, or anyone else
exempted from that?

Q. What do you call an anti-coder with an Apple computer?
A. An iTard.

Q. How many anti-coders does it take to screw in a light bulb?
A. Only one. But none will try.

Q. How can you get an anti-coder to speak intimate terms of endearment?

A. Super-glue a picture of Al Gore to his mike.

Q. Why did the anti-coder smear grease all over his antenna?
A. So dem SWR's will slide right off!

Did you hear about the anti-coder who made ten pit stops at an oval track race? One stop for gas, the other nine for directions.

An anti-coder goes into a ham store and picks up a 50 foot roll of coax. After staring at it for 10 minutes, he was asked what he was doing. He said he was trying to figure out which end went to the radio and which end went to the antenna.

Then there was the anti-coder who said a "heterodyne" is a restaurant for straights.

Q. Why were the roomful of anti-coders crying?
A.. The local welfare office closed for a month.

Q. What do you call the morgue at an AIDS hospital?
A. The anti-coder Hall of Fame.

Q. How many anti-coders can you stuff into a shoebox?
A. All of them.

Q. What do you call a bunch of anti-coders in a welfare office?
A. CBers at their watering hole.

Some anti-coders were told to to "dress for success." Then, the local Wal-Mart had a run on rainbow underwear.

Q. How does an anti-coder spell "relief" ?
A. He can't - he's afraid of the alphabet.

An anti-coder goes into a restaurant and sees some lobsters in a tank. Feeling sorry for them, he hides them under his shirt, takes them out to the woods and sets them free.

Two anti-coders were riding in the bed of a pickup truck. The truck goes off the highway into a lake. The driver rolled down the window and escaped to safety. The two anti-coders riding in the truck bed drowned,

because they couldn't lower the tailgate.

Hear about the anti-coder who applied for a Lewinsky class license? He said that all he had to do was blow the code and then he could blow the VE.

Jay, I think you are totally misreading the bits that you posted that are allegedly Carl's. I say allegedly because I take your word for it that they are really from posts of Carl's.

The items I see posted are expressions of disdain for people who treat the airwaves of the ARS as they would any other radio service, which is somewhat dismaying even to me. I think Carl means to berate those who attain a license and then get on the air with lingo, topics of discussion, mannerisms, etc., that are not desirable on the ham bands.

I don't think Carl means people like me. I do think you're presuming an awful lot to speak for him, though.

Could you tell me in what way you think Carl is speaking of me? I use proper operating procedure on the ham bands, don't carry on with topics inappropriate for ham radio (though, I have been known to include myself in innuendo at times), among other exemplary behaviors. I truly don't think Carl is speaking of people like myself as, while yes I am mostly an appliance operator, I don't add insult to injury by acting like an idiot on the air...

Carl, are you paying attention to any of this? Who's misinterpreting? Me, Jay? Believe me, I can handle your answer...LOL, either way. Because either way, you won't change me as a person and I do consider myself a darned good operator. So, if you'd care to comment, please do.

heh heh heh, it scores me as "obese." While I consider myself overweight, I don't envision myself as obese in dimension. I don't look like a Mimi character, or a Roseanne Barr, maybe just slightly less than someone like Rosie O'Donnel (is that her name?).

Anyway, I found myself wondering today if our discussion of weight is to somehow place judgement on people for their over- or underweight status. Hopefully not, as it has nothing to do with a thing...

How'd we get talking about weight? LOL

I think many of us try. I think all of us should. However, the Basis and Purpose is not stating that it is an absolute that every ham be as the Basis and Purpose calls for. It's not much more than a recommendation.

No, no DX. However, a rose by any other name is still a rose, right? Tell me what the difference would be between 150 or more calls from nothing but US stations would be like as opposed to 150 or more calls from all 'round the world? I am not sure I get your point and would appreciate some clarification.

And, that I am experienced is *your* words, not mine. I think you're sadly mistaken.

Hey, go full tilt. Every piece of junk mail you get, put the words "RETURN TO SENDER" on, ship it back to them and let *them* fill their landfills up. Yep, do it every day. Same thing with what you think is excessive packaging. Might cost a little, but ship it back and make it *their* problem. (I don't do that, but I know people who will). I do send the junkmail back, have a pen in my vehicle just for when I stop at the mailbox.

> exempted from that?

All right. Let's get into the meat of this matter:

[Code of Federal Regulations]:[Title 47, Volume 5]:[Revised as of October 1,
2001]:From the U.S. Government Printing Office via GPO Access:[CITE:
47CFR97.1]:
[Page 576]

TITLE 47--TELECOMMUNICATION

CHAPTER I--FEDERAL COMMUNICATIONS
COMMISSION (CONTINUED)

PART 97--AMATEUR RADIO SERVICE--Table of Contents

Subpart A--General Provisions

Sec. 97.1 Basis and purpose.

The rules and regulations in this part are designed to provide an
amateur radio service having a fundamental purpose as expressed in the
following principles:
(a) Recognition and enhancement of the value of the amateur service
to the public as a voluntary noncommercial communication service,
particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to
contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through
rules which provide for advancing skills in both the communication and
technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio
service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to
enhance international goodwill.

First sentence: does not stipulate radio amateurs, but the "service" as a
whole. This could be deemed to mean "the majority," since it is a given
that an entire body of people is not going to fall exactly within the
specifications of the Basis and Purpose.

Are we each exempt from any of the above provisions of the Basis and
Purpose? As individuals, yes (it is not the Basis and Purpose that defines
how we should become an amateur radio service that has a fundamental
purpose). Does the implication of the FCC mean that *they* believe in the
basic goodness of the service and that people will govern themselves
accordingly? Yes. Does the same implication mean that the FCC chooses not
to dictate what it takes to *be* an amateur radio service meeting the above
Basis and Purpose? In my opinion, no. Otherwise, there would be no Rules &
Regulations.

Also, I will rest my point on the following, opening phrase of the FCC Title
47, Part 97 R&R: "The rules and regulations in this part are
d-e-s-i-g-n-e-d..." It is the *RULES AND REGULATIONS*, as specifically
written by the FCC, that are *DESIGNED* to bring about the behavior of the
amateur radio service to meet the stated Basis and Purpose. It is *NOT* the
Basis and Purpose that is saying a thing...it is the Rules & Regulations.

Are we exempt from a)-e), above? Sure. Are we exempt from the Rules &
Regulations of the FCC? No.

Ya chase the moths outta yer wallet and pop for or BUILD God Forbid a
high power antenna tuner and set up the tuner with an antenna analyzer
before ya dump the xcvr and amp on the air. Or if the moths just won't
go away and ya refuse to pop for the analyzer ya crank down the output
of the exciter, feed it's output into the tuner and use a swr bridge
to tweak the tuner to keep the qrm down. Then ya swap the jumper
feeding the tuner to the input of the amp and hook the output of the
amp to a dummy load and tune the amp for max output into the dummy
load. Then ya connect the jumper from the tuner input to the amp
output connector and tally-ho-ho-ho.

Source record: 32229

Historic note:

Way back in the early 1930s, when the ARRL November Sweepstakes
was in its infancy, the rules were quite different.

For a contact between two stations to count for points, a genuine message, in ARRL standard format, with a text of at least 10 words, had to be sent between the two stations claiming the QSO. More than one message could be passed to earn more points. Messages could be originated by one of the stations, or relayed. The contest went on round-the-clock for 10 straight days.

The current SS exchange is based on the preamble of the ARRL message format.

The Ancient Ones had the right idea.

>
>It used to be part of the Novice pool.

Not when I was a Novice. I learned them anyway, even though I rarely operate
'phone.
The time to learn stuff like phonetics is before you need them.
>
>> I also think hams should know Ohm's Law for DC and its practical

>
>I have written suggestions to the "test creators" on the same point.

I put detailed ideas on written testing in my comments to the FCC. So did many
others.

Yet it's still possible to know absolutely nothing about Ohm's Law and pass all
of the writtens, right up to
Extra. That's just not right, IMHO. FCC doesn't think it's a problem, though.

***[snipped absolutely obscene listing of the outrageous volume
of competitive games cluttering and trashing the HF bands on
virtually every weekend ... there ought to be a ban ...]

Carl - wa6vse
wa6vse@fast.net

This ones for Kim... (note this applies to ALL people who like Kim are
not the least interested in the technical aspect of amateur radio (sorry
Kim..there's absolutely no other way to interpret CS's comments on this
one...maybe BS (Bill Sohl, he's favorite suck up can :-)))

***I have said that people who just want to yack, beep, chase DX,
contest, etc. WITHOUT interest in or understanding of RADIO principles,
theory, etc. are not true hams and belong in one of the other personal
radio services.

***Wex, most hams are not "techies" today. The bulk of the population
are appliance-operating communicators. A high percentage of those
on HF merely use the radio medium as a playing field for various
forms of electronic paintball wars (contests, busting DX pileups,
etc.) where radio is rather incidental to the real goal of "collecting
points" (or "wallpaper"). This "macho" stuff has little appeal to most
of the real "techies" I know.

And this gem from CS who so proudly puffed out his chest and proclaimed
he worked 76 countries 52 states, 8 provinces, 4 planetary bodies, 2
galaxies and 1 alternate dimension....

***So what??? You make it sound like DXCC is the pinacle of
achievement ... I could care less about chasing DX or
collecting senseless wallpaper.

So boys and gals..interpret away. Bill, begin the spin. I wonder
sometimes about you Bill. If Carl stops short, will your head actually
end up in his upper intestine?? Get the connection? Oh that's
right...I am an anon, a nameless faceless person, like so many here.
Guess that puts me at the advantage Bill. I know all about you and your
wondrous exploits of amateur radio NOT.

Oh well spin spin spin

Later..off to the winter wonderland..only a day late

From five to three watts . . . really impressive . . there are HF
xcvrs out there now with ATUs which do not put a tuner-upper signal on
the air at all. The Mark V ATU follows the RECEIVER around the bands.
Now yer talkin' right-now technology, the ultimate tuner-upper signal
deleter. Tell yer buddies at Elecraft about it, maybe they'll ship ya
the Mark V firmware upgrade. If they ever figger out how Yaesu does
it.
>
>
>No servomotors,
> either.
>

>
>

His cost 190 bucks and is the biggest bang-for-the-buck investment he
ever made in the hobby by a huge margin. Whatta mean "who makes it?".
MFJ makes 'em. MFJ makes some intolerable shit. But they also make the
259B antenna analyzer and the best keyers on the planet. Like Ford
made Pintos but they've also made "a few" Cobras, Land Rovers, Aston
Martins and Jags. Your point sire?
>
>
> Did the ATU work on all bands or was a manual tuner needed on one or
> more? I
> hear some ATUs have very limited range.
>
>
Gimmee a break willya? Hisself scanned that 40m g5rv from 7.000 to
29.000 in 500Kc increments with Hisself's 259B analyzer and the swrs
were fine on 40, 20 & 10 but the swr on 15 was around 5:1. All of
which data were duly scribbled & logged. Yeah, a 5:1 is well outside
the advertised tuning range of any currently available hammie ATUs and
is very typical and predictable g5rv behavior. Funny thing though, the
artifact ATU in that old Kenwood nailed a 1:1 anyway. "Over to you."
>
>

> rules as long as you don't cause QRM in the process.
>
The bottom line in all of this crappola is that by using the
technology now readily available and affordable down at the hobbyist
level once again there is no excuse for dumping a 1960s-style
twenty-over "tuner-upper" signal onto any HF ham freq tweakable
pi-nets or a lack thereof, sky-high swrs, a self-imposed lack of
curent-tech instrumentation and tuners, all non-sequiters.
>
>
To hell with whether or not a "tuner-upper" signal is legal, it's just
plain rude and is unacceptable 2002 operating practice.
>
>

. . . 1960s Tuner Upper sigs on the bands = LID

>exempted from that?

That's what I said. The FCC encourages, but does not mandate, that individual hams meet the goals it has stated for the Service. I do not do public-service communications. My contributions to Amateur Radio are directed elsewhere.

Do you feel that Amateur Radio would benefit if I were to do less of what I do in ham radio and did some public-service communication instead?

Yup. But the old Novice was only good for a year and was a one-shot deal. It was more a "learner's permit" than a permanent license.

> Today, new hams have to learn something about the
>difference between the near-field and far-field regions around antennas to
>understand the questions about RF safety.

BUT they DON'T have to UNDERSTAND those questions in order to get them right because the Q&A are not secret. And they can get ALL the RF safety questions WRONG and still p-ass all the writtens.
>
>Nothing like the good old days, eh?

When you tell the whole story, it looks a bit different.

--

You might be interested in a discussion started by Richard Plourde on what the US license structure should be like in a post-S25.5 setting. It's in a thread called "S25.5 Proposal Peoposal" or something like that. It answers the "200 page book for beginners" problem.

60 wpm typing is pretty fast...more than that required
by any company that had typing as a requirement
for a clerical position. These days, most every new hire
for any job comes with "keyboarding" skills, so they
"type" their own correspondence rather than hand
writing a draft or dictating same to a secretary.

Really BAD example since PennDOT or any other state DOT doesn't
usually get to unilaterally make such demands. It is generally the
legislative body that writes the laws which establish drivers license
requirements. Even if the DOT could unilaterally create such
a requirement, the public outcry would kill such a dumb, "overkill"
requirement.

True...BUT, in truth, there's nothing sacrid about saying Alpha, Bravo,
Charlie... then using Apple, Boy, Cable if you didn't know the
actual international phonetic alphabet. Non-hams do that all
the time.

though.

The only solution to what you focus on is to break up the tests into
subgroups of subject matter which then must each be passed with

a minimum score. Odds are, however, that there's only a finite
breakdown that makes sense...e.g. Rules, Safety, Theory...and
in doing such, someone could probably still pass the theory segment
and never do a calculation requiring a formula.

I know of at least one town that has a well setup "mobil" station
vehicle that is, I believe, in an old ambulance. It has as much
gear as a base station.

And I have yet to see/hear of any local emergency
people (non-hams) that have any affinity for morse
being used. Those local emergency people prefer to
Not be needing an interpreter (which is what the CW op
really is doing) but rather they prefer to hear the actual
voice statements or read the text immediately off a terminal.

>
> I doubt it. Not secure.

Is "commercial" permitted to encrypt? The military certainly
can, but the vast majority of operations don't require
encryption. Likewise, local police don't do that much encryption.

Brian: You may prefer tuning through off-air methods. However, it is not required and does break any FCC R&R to tune with a carrier on-air. Plus, I am not even sure I've ever even seen that much written to support either method as being the only proper way to tune. Your posts, such as below, are a truly uncalled for attitude.

Jay: There are support groups for your malady. I really don't see the correlation between Carl's dismay with piss-poor ham operators and those who--like me--*are* the embodiment of a non-technical ham *BUT* conduct themselves within all accepted operating practices on the air. I think you are painting much too much into Carl's posts. However, you also seem to be reacting in a way that leads me to believe *you* would be one of his targets. You sure do act like it in your posts.

Buhbye, ain't got time for your rambling, and CBish style warring.

I would hope that we wouldn't use how much someone weighs as a measure of their value in life. (although being an appropriate weight is a good and healthy thing) The other point is, don't take the test *too* seriously. I am at the upper edge of the standard height/weight charts. I am 5-10, 165 and don't think putting on a few pounds would hurt me a bit. I took one of these on-line health tests once, and it said that I should weigh 163. They suggested that I go on a diet and lose the two pounds because I was above the average for my height. : -))

According to my sister, who works as a postal worker, there are differing circumstances--probably one of which you mention above--and sometimes the post office *does* end up with the stuff in the dead letter file. However, enough of that and the post office won't be so indifferent to the problem of junk mail and its impact on our environment.

Shipping a package back that contains excessive packaging for the originating offender to dispose of would be paid for by the shipper, not the post office. As I said, the people I have known in the past (many years ago when I "green" conscious) who did this were willing to spend the bucks it took to send the packaging back. If I recall correctly, and I may be way off-base, this was either thought up by Ralph Nader or he was one of the responsible people for "spreading the word" on it. I believe that packaging today comes more into line with reasonable, as a result of the threat of this idea catching on. Some people also used to go so far as to purchase

the product, unwrap right there at the store, and leave the packaging there.

But, this is all way off topic of ham radio, unless you know of manufacturers who package their radios excessively.

I'm with you on people-value. Yeah, while I am definitely overweight--hell,
no argument there--I "carry" it well I think. Heh heh, it's all over! I've
also had the "advantage" (if you could call it that) of going from one
extreme to the other. All through my teen-age years and up to about 30, I
was anywhere from 118 lbs. at my first son's birth to fluctuating between
121 and 130. When I met my southern husband (re: lots of fried foods for

eating), I put on maybe 10 pounds for the first few years. Then, we started going out a lot for eating--yep, I think that has a *lot* to do with it--and, then I quit smoking five years ago--although I really don't think that had that much to do with it because I don't *think* I ate like most people who quit do.

So, I've gone from skinny (actually quite shapely if I say so myself...LOL) to not-so today (however, I've still got curves at my waist). I'm also nearing 50 and would dare nearly anyone to meet whatever pretend standards they develop that say we should still be our shapely, young selves. As we grow older, in my opinion, we begin to realize the things that *really* matter in good people: honesty, kindness, cleanliness, ethical, etc.

The word "afraid" has a few meanings. "Afraid" as in "afraid to admit you
might be mistaken"

What I'm saying is that you suspect that doing the search would show
you facts you won't like. People are often afraid of new information
because it may destroy cherished illusions.

> I am
>truly confused by such a statement.

Read the post that comes up when you do the search (only one post
comes up).

If you're not afraid, that is. ;-)

In article <a2ub0cffv1@slb1.atl.mindspring.net>, "Bill Sohl"
<billsohl@mindspring.com> writes:

>> What's an HW-201?
>
>Isn't that the old Heathkit linear?
>
Nope.

In Heathkit terminology, the HW-prefix means "transceiver". HW-7, HW-8, HW-12,
HW-16, HW-17, HW-22, HW-29, HW-32, HW-99, HW-100,
HW-101, HW-104, HW-202, HW-2026, HW-2036 to name a few. ;-)

Heath's most popular HF linear amplifiers were the SB-200 (pair of 572Bs) and
SB-220 (pair of 3-500Zs). These were slightly modifeid and renumbered SB-201
and SB-221 when the FCC came out with the external RF amplifier rules in 1978.

There was also the KL-1 "Chippewa", a true deskcrushing BA (pair of 4-400As)
and the much less expensive HA-10 (quad of 811-As).

Then there was the HA-14 (pair of 572Bs) that was meant for MOBILE (!) use -
but it had a fixed pi-net loading cap.

Finally the SB-1000 (single 3-500Z) came along, last of the line.

HW-202 was a 2 meter FM rig, xtal controlled.

I'm serious, Brian. My HW-201 was like that. I assume most of the
Ameritron amps are like that today. Why would anyone spring for
a $400 external tuner when the pi-net tuner is built in?

Of course, I don't have that problem since the impedance seen by
my SGC-500 amp is always between 25 ohms and 100 ohms.

Well, it certainly seems foolish to shell out $400 for an external
antenna tuner when the amp has a built in pi-net tuner. When I ran
an SB-201, I had a chart on the wall that got me close but I fine-
tuned the amp on the air. For years, I have been running my present
SGC-500 and preadjusting the length of my ladder-line for a match
so I don't have to tune up on the air any more.

Shouldn't be a problem, as the tests are done Farnsworth style.
That is, the characters are sent at some higher speed like 13, but
are spaced out at intervals that average it out to 5wpm. The
theory goes that once you can do that test, it doesn't take all
that many hours of operating to find yourself operating at high
speed.

The Alpha Bravo Charlie phonetics were chosen for several reasons:

- None of them rhyme or even sound alike much
- People tend to say them the same way even with accents
- Almost none of them are place names (India, Lima, maybe Sierra)

Result is that you can punch a phoneticized voice transmision full of holes and
still understand it. The use of nonstandard phonetics can mess up that feature.

For example, if somebody uses "December" for D after using "November" for N,
it can cause confusion.

As will I.

Two rules if one is planning to use his encryption technique for long:
never encrypt the same thing twice and never encrypt what the enemy
already knows. The Japanese made both mistakes at Midway and it cost them
their lunch.

I am usually the first to say when I am mistaken. I have no problems with
being mistaken; and think it's rather childish when people expect perfection
all the time.

>

I don't know that I have a personality for "facts I don't like." And I can
assure you that, at least where a newsgroup is concerned, I have no
"cherished" anything...ROFLMAO!

Man! The more you OFs (said affectionately and with tongue in cheek) talk,
the more I really begin to wonder about whether ham radio truly ever did
have any "traditions." ;)

I just noticed my severe mistake above. The last part of that sentence
should read "and does n-o-t break any FCC R&R to tune with a carrier
on-air."

>
> He's not arguing legality. Just good operating practice.
>

Oh, bore. Another one of those magical gentlemens' agreements? I'll tune
on the air if the FCC ain't gonna bust me for it. If you don't like it,
Jim, or if anyone else don't like it, you can move your prejudices to
another frequency--I suppose. Or, you can choose to let it ruffle your
feathers from here to the next century.

> >

>

Well, knock me down and call me stupid. I *forgot* to ask every darned
amateur radio operator there is in existence before I made such a wild, wild
statement as *I AM NOT SURE* (a blaring uncertainty there). You're not
going to tell me that QST is the only source for information are you now,
Jim? Tell you what, there's a good poll for the ARRL to conduct: "How do
you tune for transmission?"

A) Through a dummy load
B) Through carrier on the air
C) Tune? I didn't know we're allowed music on the air

My *bet* (yes, there is a definitive statement for you, Jim) is that the
majority of tuning occurs on the air.

Obviously Kim has missed the simple fact that two of those three think it's OK
to
tune up on the air if done in a considerate fashion.

What has been documented are ways of tuning up without emitting a signal.

Ah. So in 50 years you've never actually participated in the
hunt for a new one, but only sat aside and formed your detached opinions while
the hunt was actively conducted by the real hunters. Sort of a kibitzer. And
in so doing, you learned all about it. We see.

I'd wager the Special Forces had developed no contingency
plans to become horse calvary either.(a la recent operations in Afghanistan)

> Been there, tried that, it didn't work.

Worked for the Special Forces! Obviously there is nothing to be gained in
using less than than optimal modes where better are available, especially in
those circumstances. Police departments nationwide used radiotelegraphy for
routine long distance communications for several decades beyond the arrival of
TTY/RTTY, for cost saving reasons. They merely hired dispatchers who were also
CW operators, and they did dual duty. Lots of them were hams.

I am fully aware of the period of validation for a CSCE. I just wanted to see you say it. You made it sound like it was the most difficult thing in your life to accomplish. But think, if you upgrade within the year, you will never have to deal with it again.

I do agree that you have met the requirements at the time of testing. That is something that we don't have any control over.

What I don't understand is why you wouldn't upgrade within the year so you could use the privileges you earned. I was an Advanced class and still didn't have an HF radio. I did get one shortly thereafter. However, that didn't mean that I couldn't use a club station rig or go to someone's shack and operate until I did.

That's not encryption, though. It's just digital signing. I figured that's what Jim meant but thought maybe he was referring to something different that I had missed.

> Why?

He claims that people have forged posts in his name. And that's not exactly unknown on Usenet. Using PGP signatures make it impossible to do that undetectably. Whether that's paranoia or prudence is a matter of opinion.

Jon

Then why havent you upgraded, it isnt that really really tough written test, is
it?
I know that written can really cause you trouble, it has some really tough
Questions , like your Name, Addresse. And for alot of you Mentally Challenged,
those can be really tough Questions. So again why havent you upgraded??

Oh, gosh, sorry. My point is that three people discussing the ways of tuning on RRAP are not a good "poll" Jim. I haven't read the text in all the posts on tuning, as I don't care how you or Brian, or Joe Schmoe tunes. I'll tune with a carrier.

Point is, there's nothing illegal about it. Three peoples' opinions here on RRAP do not a majority make. Get the ARRL to do the poll.

>
> Why would anyone spring for
> a $400 external tuner when the pi-net tuner is built in?
>
>
First off it was SOP in days of yore to dump tuner-upper signals on
the bands for exactly the reason you cite. IF all yer antennas
have/had swrs which fell/fall within some short range around r5ï¿½+jï¿½. I
always had a homebrewed Kw tuner in the line because my lo-band
antennas were usually not nice tame coax-fed dipoles. And yes, I
dumped out tuner-upper signals because all I had was an swr bridge.
But I cranked the power 'way back to set up the tuner then I put the
amp online and did just what you did/do.
>
>
But that was in the days of yore. Technology improves and becomes more
affordable and time marches on. My *only* point is that these days
there are ways available to eliminate or at least greatly reduce the
volume of tuner-upper signals on the bands and that we have an inate
responsibility to do so.
>
>
Your mileage may vary but I haven't put a tuner-upper on the air for

several years.
>
>
> Of course, I don't have that problem since the impedance seen by
> my SGC-500 amp is always between 25 ohms and 100 ohms.
>
>
Good example of where it's all headed. That amp can't be "tuned"
either just like my 940 can't be tuned. Add rcvr-following kW ATUs
feeding coax-fed antennas and there ya go, no tuner-upper signals even
from the QRO crowd. Gonna happen.

If I said "afraid" of concealed weapons (and I don't think I did), then it
was purely a mistake. I *DON'T AGREE* with concealed weapons (guns to be
specific) not because I am afraid of them or they scare me--but because I
believe in open carry as the greatest deterrent to threat, the greatest
education on gun safety, and the greatest tool for desensitizing fearful
fools.

Well, I actually considered changing my thoughts above when I read this
(I never "read ahead" when I respond to these things--my mistake,
huh?). BUT, I left it so that you could *maybe* see how, out here, it
looks like you yourself are "hating" as much as you claim someone else
is.

[I SNIPPED THIS ONE TOO]
I will always be sure to be operating within regulations, either by
having learned through repetition or by always being sure that I have
resources nearby to "look up" things. So, to learn by being on the air
is relative...and it was my mistake to generalize what I meant by that.
If I suddenly decide right this minute that I want to go do some CW on
any other band than 10M...I would have to look up my frequency
priviledges.

Are you being deliberately belligerent? The NCI doing a poll on the most popular method of tuning (on or off the air) would be pretty stupid.

Glad we understand each other, Brian. You act like one, too. I am beginning to wonder, really, what the difference is between a CBer who doesn't like someone and a ham who doesn't like someone. They act exactly the same way, to a 'T'.

I'm not a masochist, Dick. Why should I participate in something I
find to be a pain in the neck? What is wrong with live and let live?
Why do all hams have to be DXers? I've said before, if something is
difficult, I'm not interested in doing it.

From something you said on r.r.a.a, I assume you don't like anything
except 50 ohm antenna systems (no reflections). I like experimenting
with all sorts of antenna systems including non-resonant systems.
Does that make me a better ham than you? Of course not. It simply
means that there are all kinds of interesting things in ham radio
for individual hams to enjoy.

Ed,

We are aware of the positions of *some* of the ARRL directors,
(for or against I'm not saying ...) but in most cases, those views
have been given in some sort of confidence and it would be
unethical of NCI to make such private conversations public (as
you point out).

SIight correction: "Carl is saying that, IMHO, and from comments
I've heard/seen from many, the subscription to QST is a SIGNIFICANT
reason that MANY people join ARRL." It is clearly not the ONLY
reason,
but, as I stated, IMHO, if the subscription to QST were separable from
membership, many would opt for the subscription only option.

BTW ... I would NOT be one of them.

That's actually a very good question ... I suspect it could
only be "measured," ... more accurately, I guess, infered,
from the results.

> If every single US member of NCI who is not now an ARRL member
joined,
> how many would that add to the ARRL membership? Probably less than
1%.

If you re-read my original post, I believe you'll find I said "If NCI
encouraged every no-code/slow-code amateur who's not an
ARRL member to join ... " etc. I don't believe I limited the target
population to NCI members.

[snip]

Getting down to the quote which I didn't see until I scrolled down,
I'm gratified to see that my memory has not failed ...

> >I have occasionally thought that one of the smartest things

> >of Morse testing in US rules as soon as the ITU Radio
> >Regulations permit.
>
```

> That would work IF the number of nocodetest hams in the USA were
> significant enough to make a difference in director elections.

If you look at current ARRL membership as a % of the number
of licensed hams in the US and also look at the number of
no-code/slow-code hams relative to "fast-code" hams, I think
one could correctly infer that the numbers are very likely large
enough to make a significant difference in the outcome of an
ARRL election, if those folks all joined, nominated a slate of
director candidates who *promised* to follow their views, and
voted for same.

> substantial modification - which generally requires (besides skill) information
> (e.g. schematics) that the commercial manufacturers routinely DON'T PROVIDE.

The 2.4 GHz gear I'm talking about allows the user to select the channel(s) of operation within its capability via software ... no reason that hams couldn't limit their operation to the channels which fall within the band segment that hams are allowed to use ... no mods or schematics required.

Also, higher power, if needed, would be added with an external "brick" in all probablity, though I recently did a link budget calculation for a 6 mile link from my QTH to my company's closest facility and with a 20" grid dish at each end, I'd have link margin to burn for super reliability at 11 Mbps with a transmitter output of only +15 dBm (std output from the PCMCIA card) ... if I were willing to settle for a couple of Mbps (at least a T1 equivalent), I could either use smaller antennae, drop the power, or support a longer path with the same antennae and power.

[snip]

> Then why do manufacturers publish their ranges in feet.

The largest volume is in the PC-client to Access Point LAN environment ... I assume that you've seen data on products optimized for that market space ...

>Also, your example is
> not consistent in that you are adding antennas (the dishes) at each end, which
> is NOT part of the part 15 spec because the devices, as approved, don't come
> with dishes, but instead, these flimsy antennas that are more like an HT's

> "rubber duck" than anything else.

There are provisions for external antennas ... and Part 15
does not disallow their use ... Part 15 allows DSSS devices
transmitter output power of up to 1W (most devices don't
transmit near that power level because it's not needed in
most applications) and an antenna gain of up to 6 dBi without
a reduction in transmitter output power. Above 6 dBi antenna
gain, there is a backoff equation ... which requires a 1 dB
reduction from the 1W transmitter output limit for each 3 dB
that the antenna gain exceeds 6 dBi ... thus it is possible to
achieve fairly substantial EIRPs ...

> >This technology is inexpensive, reliable, and within the reach
> >of amateurs ... like Ed said, it seems a shame that more hams
> >aren't using it (or developing something like it ...)
>
> And as I have said, there are problems with that idea, as noted
above. It is
> not "as inexpensive ... [or] within the reach of amateurs ..." as
you say.

The going street price for an 802.11b 2.4 GHZ 11Mbps wireless
LAN card is well under $100 these days ... I'd call that "inexpensive"
for the capability it can provide ... certainly an EXCELLENT value,
compared to a 1200 or even 9600 bps "TNC" when one considers
the fact that the entire radio solution and all software are included
and
the significant increase in performance provided.

73,
Carl - wa6vse

I don't believe I was asserting that we necessarily need more
repeaters (though coverage and reliability might be enhanced
by having more, if they could share the spectrum effectively).

>
> How does having a dedicated pair cause it to be idle?

In the case of many metropolitan areas, at least, the pairs
have been "gobbled up" and given coordination to a user
group who may only infrequently actually USE the system,
but keep it closed to "outsiders" and refuse to share the
pair with another system.

> The REAL problem, it seems to me, is that there are more repeaters

> phone company.

No, but "the phone company" employed some of the brightest
minds in the world, who over the years developed a great deal
of insight into how to build ecomomical, effective, high capacity
communications systems. Much of that body of knowledge is
directly applicable to improving ham radio's use of it spectrum,
the availability of interference-free channels on demand, etc.

(IF we are willing to accept something "new" ... that may have
been invented and put into commercial practice many years
ago ...)

> >In fact, in such a system, voice and data use could be

>
> All depends on the demand distribution.

No ... what I'm contending is that a properly designed
system where bandwidth is dynamically allocated on
demand will outperform a system where channels lie
fallow because their use is artificially "restricted" to
certain uses (which may not be in demand at any given
moment, while bandwidth for some other use IS in demand)

I personallly think that the REAL problem is that too few hams
can see the possibilities (or like Dick, flat out refuse to accept
the possiblity that any change from "the way things have always
been" could result in true benefits.)

Ahh, so that's why I don't understand it. All this time I've been blaming
it on those darn Maxwell equations.

Secrecy, the root to all understanding.

2812. Re: Digital Radio and "Future Systems"

>
> Given the useage of amateur frequencies on most bands, such waiting
is not at
> all likely. One would only have to wait if all available
frequencies were in
> use.

I think you're missing my point, Ed ... most repeaters
have a certain user group (plus or minus "transient
users") ... those folks have developed a mindset that
"their channel" (the repeater pair) is always available
for their (more or less) exclusive use. So they tend to
stay parked on that channel, "waiting for Joe to show
up so they can talk to him."

If another group were to put another repeater on the
same pair, then the two groups would have to wait for
each other to finish using the shared channel. So, it's
not a question of ALL frequencies being busy at any
moment ... it's a question that users don't want their
preferred frequency to be occuptied by "outsiders"
when they want to use it ... this has resulted in many
"repeater wars" over the years.

All I'm saying is that dynamically allocated use of
the spectrum (as in commercial trunking systems)
would result in the ability to support more users
without contention (for the media, as well as politically
and emotionally :-)

> The real rub is that there IS a need for such a system, even in the

> 73,
> Ed Hare, W1RFI

And such "industry consensus" standards evolve to meet expanding
needs ... I just spent last week in Dallas at the IEEE 802.11 meeting
(an every 2 months event) with a whole (huge) hotel full of others
working
on just such things ...

And what's wrong with the 3-class license structure we have
now? (except for the unnecessary, except for S25.5, code
test element, of course)

All 802.11b devices that I am aware of (and my employer has ~50%
market share) come with software which allows the user to define
a number of network setup parameters, including which channel, from
the allowable ones, the network will use.

> >so please fill us in.

I have replied via e-mail to Ed that I can't explain off the top of my
head
how the network name is distributed ... I'm more of a "PHY" (physical
layer)
guy than a "MAC" (medium access control) guy ... the network name is
obviously distributed, as all nodes in a network know it, but I don't
know
all of the exact details on format, how often, etc. I will try to get
the answer
to this question.

The easiest solution would be to persuade the FCC (if it hasn't
already been done, it should be) that the use of IP addresses
from the ampr.org domain are functionally equivalent as IDs to
callsigns, since they map one to one and the mapping is publically
available

> That gets to my other problem. Manufacturers of this hardware don't
provide
> the necessary information (i.e. trade secret) for us to be able to
readily
> modify this equipment. We clearly have two requirements:
> - To stay below 2450MHz, and

No problem, as Ed and I have both pointed out ... simply set the
right channel in the provided configuration software. No modification

required that I can see ...

> - To identify (in mode)(*)
>
> (*) - Due to its frequency hopping,

While the 802.11 standard does define a FHSS mode,
it is virtually unused ... the 802.11b DSSS-CCK extension
to the standard has taken over the market, since it provides
11 Mbps vs. the 2 Mbps maximum of the older base standard.

> I don't believe that ID'ing in morse code
> would be practical (or valid)

Nor should it be required ... IDing in Morse would be extremely
wasteful.

> unless the code is slow enough that every "dot"
> happens to have part of itself land on every used frequency in the
hop pattern.

> signal) between a modified system as amateur vs. part 15 (its
original
> origins)? Not everyone has a spectrum analyzer, etc....

I believe that the easiest way would be to only "join" networks with
IP
addresses in the ampr.org domain ...

manufacturer,
> especially considering the original spec. (indicated below).

It is spread spectrum, according to the Part 15 rules ... however,
a single channel doesn't use the entire 2400-2483.5 MHz ISM
band ... nor do/did the Part 15 rules ever require it to do so ...
Im not sure where you got the (apparent) idea that a single device
used the entire band at once.

The issue of 802.11 FHSS equipment is rather moot, since that
part of the standard effectively died years ago when the 11 Mbps
802.11b extension to the standard came to market ...

BTW ... the IEEE 802.11 standard and its released extensions
should be available for FREE download at:

http://standards.ieee.org/getieee802/

(be prepared for quite a bit of reading ...)

The paragraph above makes a VERY good point ... Part 15 devices
"live" quite well in the shared band environment because they are

applied sensibly and the modulation, coding, and protocols are
robust enough to provide reliable operation despite the interference
environment in which they must operate.

The solution to reliable operation (for hams as well) is to use
good engineering techniques to arrive at a solution that works,
rather than always expecting some minimalist approach to work,
based in the idea that the channel will always be "clear."

The user's manual fro my Yaesu Ft-847 lists a rather impressive
range of operating frequencies. Do I assume that it operates on
every frequency in that range simultaneously? Of course not ...
in fact, I think it goes without saying that I (and others) would be
most upset if it did ... :-)

I just don't get where you got the idea that DSSS devices, of
necessity, used the entire ISM band at once ...

Encryption can be turned on or off ... not an issue ... hams would,
obviously, because of the requirements of Part 97, run with the
encryption turned off. (but don't get me started on how I think
the blanket prohibition on encryption is unnecessarily stringent,
that's a whole 'nuther subject that I'd rather not get started on now
:-)

Ah, yes, so true. However, you're quite wrong about my bringing size and weight up first. The line you have so carefully chosen out of context in order to attempt to prove a point that does not exist--except for possibly in your own mind--is one that was in reponse to the boring Jay, who had the following to say--thus being the first comment on size and weight (NOTE: Care to keep up with retrieving old posts, by the way?):

Jay's post:

In article <3c4f6f25$1_2@newsa.ev1.net>, seventythree@eightyeight.net

Why would knowing the position of a BoD of ARRL be unethical? I would think
they would *want* the membership to know. Unless, of course, it went
against the grain of what the majority of members wanted, Hmmmmm.

The change to the SS part of the rules I missed, because as a volunteer examiner, there were many more changes that I had to actually pay attention to.

What TAPR says is unimportant. Too many people have placed so much artificial importance in that group, their statements on anything are effectively worthless. A TAPR endorsement of anything is basically detrimental.

But as Ed Hare noted, these devices usually DON'T say so on the box, but simply say something like, "Frequency range: 2400-2483.5" even if they only choose a 20MHz window in that range. Are we supposed to GUESS?

Now, that someone has finally said that it is possible to use WITHOUT
MODIFICATION (because what the manufacturers publish on their packaging is
misleading and/or just plain wrong), that makes a difference.

As noted by Mr. Hare too: Mr. Ham goes into store. Mr. Ham sees 2.4GHz wireless lan stuff. Mr. Ham picks up box, reads "2400-2483.5" as the range, and puts it down, because, not knowing this well-hidden variation to the standard, Mr. Ham does not know that this means a 20MHz window in that range, and thus discounts the complete idea because modifying the equipment to keep it in band (a necessary step perceived by Mr. Ham due to improper disclosure on the box) is too difficult or takes too much time.

What is wrong with that picture? Nowhere was Mr. Ham able to find and learn about this 20Mhz window of operation feature that makes otherwise [perceived] unusable equipment (due to out of band transmission) usable (and wholly in band).

As a person involved in manufacture, shouldn't you be telling your potential [secondary target] market about this?

Personally, until this thread surfaced in this group, I was like the fictitious Mr. Ham above - not knowing the difference between the .11 and .11b standards. I admit that I have learned something.

From the fact that the box of such a device specifies the ENTIRE band as its frequency range, that implies that its hop sequence includes frequency slices across the ENTIRE band, not a limited subset of it.

>most upset if it did ... :-)

No, but you do assume that it CAN operate on any (within the channelization resolution of the VCO, etc.) frequency in the range.

With SS, one generally assumes that the device may hop to any frequency within its range. Owners of such devices don't have control over the hop pattern - such is the firmware's responsibility.

If the packaging for an SS device gives its frequency range without indicating that it can be adjusted to a subset of the range, is there a reason for someone to assume that it won't hop over the ENTIRE range given, especially considering that such was in the older specification of the standard it followed (and not being aware of the changes in the standard)?

>I just don't get where you got the idea that DSSS devices, of
>necessity, used the entire ISM band at once ...

Of course not - that would be "wide band," not spread spectrum. However, unless it is stated that only a subset is used, I do assume that a SS signal may hop onto any frequency in its defined range.

There is NO evidence that U.S. Army Special Forces have used
telegraphy or radiotelegraphy in Afghanistan in 2001 or 2002 or
that the U.S. military has used it in the Gulf War of 1990-1991.

...the mythos and misinformation continues to be propagated
through the "C Layer." :-)

Anyone interested in radios used in the police departements of
a small state such as California can look into the California
Highway Patrol radio history site at -

www.mbay.net/~wb6nvh/chpradio.htm

www.mbay.net/!wb6nvh/motodata.htm

(second one for Motorola equipment used before WW2)

For Jack Webb fans there is a larger site about the Los Angeles Police Department, including a couple of pages of their radio history, past and present, at -

www.snowcrest.net/marnells/kma367.htm

www.qsl.net/n6uru/kma367.htm

(second one is alternate entry for first, vice-versa)

Those sites have links to San Diego, San Francisco CA PDs, Denver, Lake County IL, Detroit, Bayonne NJ, Trenton NJ, Toledo OH, San Antonio TX, plus some cities in Australia and New Zealand PDs.

Best regards...and "Book 'em, Danno!"

>Man! The more you OFs (said affectionately and with tongue in cheek) talk,
>the more I really begin to wonder about whether ham radio truly ever did
>have any "traditions." ;)

If it has been published in the "official" tradition publications of the
ARRL, it is the honest-to-God TRVTH.

If it has been published in newsgroups by long-time OFs with one-
by-twos, it is the honest-to-God TRVTH. Even if some of the
truthsayers disagree with one another...they speak the TRVTH as
if it were engraved in old Roman marble, everlasting through time. :-)

The NATO phonetic alphabet was first activated in 1955 for the
entire U.S. military and for the militaries of NATO member nations
to clarify communications of all kinds. It was, and remains, a
compromise system as a result of liguistic studies by several
NATO nations. The ICAO (International Civil Aviation Organization)
picked it up for civil airways communications clarification purposes
later the same year...the standard radio voice language on civil
airways had already been adopted as English (vast majority of
pilots on and in civil airways of the 1950s spoke English).

How do I know this with such surety? In 1955 I was in my third
year of active duty with the U.S.Army Signal Corps, a somewhat
new E-5 ("three up, one down" on the sleeves) with a supervisor,
operation-and-maintenance MOS. We (everyone at ADA and all

the radio units in the Far East Command) got a whole two weeks to memorize this (then) new phonetic alphabet...and "unlearn" the old one right after the cut-over.

1955 was a time when the Cold War was becoming very hot indeed...only 5 years after the start of the Korean War and only 7 years after the infamous Berlin Blockade. NATO was not some sort of political bureaucracy, it had more to do with Survival for all. The USSR existed and had The Bomb. The China mainland had been taken over by Chinese communists. SAC had started its "loiter" operations just outside the USSR borders. We in military communications didn't do emergency comm as a "public service," but WERE the first-line Survival Emergency Communications, 24/7, all year long.

A great number of phonetic alphabets existed prior to and during World War 2. For those interested in linguistics, there's quite a complete listing of different phonetic alphabets at -

www.bckelk.uklinux.net/menu.html

As to the standard U.S. military phonetic alphabet prior to the NATO system, here is what we Signal Corpsmen learned in 1952:

Able, Baker, Charlie, Dog, Easy, Fox, George, How, Item, Jig, King, Love, Mama, Nan, Oboe, Papa, Queen, Roger, Sugar, Tare, Uncle, Victor, William, Xray, Yoke, Zebra.

...odd how something once so familiar looks so "different" 47 years later after using the NATO phonetic alphabet so long. :-)

Roger that...

What's so "bad" about high-speed touch typing? Why are you young whipper-snappers so "afraid" to learn something "new?"

Heck, as a middle-school student in 1947 I could touch-type at 60 WPM no problem...on typewriters that had NO markings on the keys!! All you kids are a bunch of "lossers!" :-) :-) :-)

>de Hans, K0HB
>Master Chief Radioman, US Navy

Thank you, Hans.

The U.S. military abandoned morse codings for IMPORTANT
communications before the USA was struck into WW2,
like around 1938. The U.S. Navy was one of the first military
branches to adopt on-line teleprinter encryption/decryption
with the U.S. Army sharing information (notably in cryptologic
methods courtesy of William Friedman's Army group) with the
Navy. As far as a lot of nit-picky crypto historians have been
able to determine, the U.S. military's "rotor" system of WW2
days was never broken...yet the U.S. broke the Japanese
rotor system and retransmitted intercepts to fleet and land
units over the U.S. system. :-)

The website of the USS Pampanito (submarine for landlubbers)
has some nice information on the old U.S. teleprinter encrypt/
decrypt system, plus links on other U.S. crypto sites. The NSA
website is now open with more crypto and detailed government
historical data from WW2.

Regardless of the charm, affection, and (sometimes) lust that
some have for morse modes, the old 60 WPM teleprinters
still beat the most expert 40 WPM morsemen and could do so
24/7. In 1940 and in 1955. A half century ago.

Unfortunately, some old-timers (some as old as 47) who have
never, ever served in any military branch purport to be "expert"
on the U.S. military. Misinformation marches on... :-)

Love How Able

No, what "has been documented" is a lot of one-upmanship-in-messaging
by those want to be "right" at any cost trying to show that they are
"expert" in whatever they choose to talk about...including a lot of
not-subtle female bashing by those this as a male enclave. :-)

Whatever analyzer ever made used EMITS A SIGNAL. [you can't get a
response without a stimulus in any antenna measurement]

What has been nattered so far on this thread so far overlooks a very
basic rule in ANY multi-user spectrum environment, ANY multi-user
radio service: LISTEN BEFORE TRANSMITTING.

"Pi-Networks" are in a category of 3-component IMPEDANCE
MATCHING NETWORKS. That they are able to match a variety
of low-magnited complex impedances to a high-magnitude impedance
vacuum tube amplifiers with a minimum of components led to their
widespread use in HF transmitters, especially to penurous hams.

There is NO magic in a Pi-Net and it does NOT ALWAYS act as a
low-pass filter and it CAN match a variety of different impedances.
Gosh, that should be quite apparent to someone who has
"mastered the Smith Chart," no? :-)

Can one assume that all transmitters can run at reduced power for
"antenna tune-up?" No, some tubes have different source
impedances at reduced levels and/or reduced plate voltages. To
some degree that is true for solid-state PAs but the Class A to
Class B solid-state PAs can be designed to run at 5 to 10 percent
maximum power and still present the same source impedance as
at maximum.

So, with an "old style" Pi-Net final configuration, one NEEDS some kind of fancy memory-holding autotuner? Ever hear of pencil and paper jotting down knob and dial markings for "tuning memory?" [pen/pencil and paper predates morse messaging]

I am just so underwhelmed by the Technical Expertise displayed by some in this newsgroup... :-)

>transmitter - assuming the specific output network can do that.

Any Pi-Net can handle that...PROVIDED the builder put in enough "output" capacitor variable range along with enough series inductance. Of course, if one wants to make it cheaply, the range is restricted and it becomes the "specific" network mysteriously alluded to...:-)

>Ya
>tune into an r5ï¿½+jï¿½ dummy load for at least two good reasons: Ham
>transmitter output circuits are designed for optimum performance
>assuming a 50 ohm resistive load.

ALL "ham transmitter output circuits" are designed that way? :-)

>By "optimum performance" I mean
>harmonic suppression in all cases and stability in some cases.

Tsk, tsk. Another mythos repeated that a Pi-Net is *ALWAYS* a "low pass filter?" Show your work, senor. :-)

Harmonic suppression depends on many things including drive level to a Class-C tube PA plus the load line selected for the particular tube.

"Stability?" Undefined there. Parasitic instability, more common in tube circuits than solid-state, is seldom a function of the output matching circuit.

> Second,
>a lo-pass filter simply won't do it's job if it's in a line with an
>8.5 swr.

Sorry, if that external low pass filter has more than two sections
it WILL do harmonic suppression...it won't do it as well as
working into a "proper" resistive termination, but that is a whole
lot of variables to toss in. Bottom-line: An external low pass
filter still works at weird terminations (antenna impedance).

You can check that out on the official ARRL Radio Designer
program if you like. :-)

> Or if yer running any power and/or using one of the low-power
>lo-pass filters ya toast it if ya have an 8.5 swr.

Sigh. Another technical misinformative statement. Go back to
Basic Networks 101 and come up with branch currents and
node voltages for different complex impedance combinations.
ANY low power external gizmo can become "toast" at perfect
match conditions using higher-than-rated power.

>So common-sense
>good operating practice dictates that ya tune the transmitter into a
>dummy load.

For the first time in checking a transmitter. :-)

>Then ya transform the r3ï¿½ï¿½+j3ï¿½ï¿½ antenna input impedance into a proper
>r5ï¿½+jï¿½ impedance with an antenna tuner and bingo the swr is 1:1 and
>the antenna is optimally matched to the transmitter. By using an
>antenna analyzer, not by dumping the transmitter on the air to tweak
>the tuner with an swr bridge.

The analyzer is very nice but what about NOT having one? Suppose
the transmitter is an "old" tube type with a Pi-Net output? Are you
trying to say the Pi-Net "only works into 50 ohms resistive loads" or
what? Suppose one is using 450 or 600 ohm characteristic
impedance balanced lines? :-)

>Of course this is the first time you ever heard about any of this
>hi-tech transmitter and antenna tuning stuff huh?

Dunno 'bout Cecil but I first heard of it all in 1953...after tuning
up transmitters ranging from 1 KW to 15 KW on HF using their
built-in output networks...into balanced lines terminating in
rhombics or delta-match dipoles. Learned a few things since.

Of course, I can't possibly match the terrific technical expertise
brought on by 20+ WPM morse mode skill so I will defer to the
kind civility displayed by all those long-time extras. :-)

indeed. I've held a license for over a decade now, but due to lack of available time and elmers once I got to college it lapsed, and I've only recently renewed it [1] at the jabbing requests of some friends. I'm a little rusty on the specific rules and regs after all this time [2], but the one thing that seems to be lacking from the [3] test pool are questions involving operating protocol. I know what frequencies I can operate on, and with what modes, but truth be told I'm still a little shaky on protocol, never having owned a working HF rig. [4]

the test seems to cover the physical layer and wire-level protocols of communication, so to speak, but doesn't really cover much in the way of actual communications protocol.

> Most of the other services wanted ham radio to go away - that's why we
> got banished to "200 meters and down".

and here I thought it was because the antennas get too big. ;)

> The real question is this: Does multiple-level theory testing cause
> today's ham radio to be more modern technologically than it would be
> without such testing?

or is such the point of modern amateur radio anymore? or has the art advanced as far as it can by amateur means?

[1] ex-KC6PVE, now KD7PNB.
[2] of course I'm reviewing... a lot has apparently changed while I was away. 5WPM to get a general? I must be going crazy.
[3] c. 1994 general pool
[4] I have a sick heath HW-101 I've been lugging around since 1992, hoping to fix one of these days. it's become a quest. ;)

you should get out more. I see plenty of PGP posters elsewhere on
usenet, and on a few mailing lists from time to time. the
authentication PGP provides can be very useful.

> His rangting on the subject is legendary, and nolt for the weak of

I'm actually browsing http://www.nocode.org/ looking for it. I recently
returned to ham radio after an almost decade-long college-induced hiatus
and came back to having my tech plus license turned into a technician
upon renewal. right now I'm trying to ressurrect my rig and figure out
where to put up an antenna so I can start listening to QSOs and slowly
start operating. I was originally planning on working primarily morse,
hoping to increase my speed to 13WPM to pass the general, (I had passed
the written years ago, but lack of practice kept me from passing the
code,) and lo and behold I now find I can get a general without 13WPM?
Odd.

Arnie ... don't try to make something out of nothing. Ed said he
didn't know the positions of all of the ARRL directors. I said that
we knew the postions of some, but that they were the result of
private conversations and it would be unethical to "go public"
with them on that basis ... if they want to state their own positions,
fine ... but it's not my place (or NCI's) to state them for them.

No, as they've said here on the internet for years, you're
supposed to "RTFM!"

[snip]

Nothing "misleading and/or just plain wrong" in what we print on
our packaging.

I suppose you went into the store as a tech+ and looked at all
the HF rigs which said their 80m coverage was 3.5-4.0 MHz
and didn't buy one because you were only allowed to use the
novice band at 3.675-3.725 MHz??? Duh!

> What is wrong with that picture? Nowhere was Mr. Ham able to find

RTFM

> As a person involved in manufacture, shouldn't you be telling your
potential
> [secondary target] market about this?

Reality check ... it's up to hams to be knowledgeable enough to
be able apply gear that wasn't specifically designed for their use
if they wish to apply it to ham radio ... tons and tons of Motorola
commercial mobile radio gear has been converted to service in
the ham bands (often with some actual modifications required) ...
does Motorola provide directions on how to modify their gear for
use in the ham bands with every unit (let alone on the box)???
I don't think so ...

> Personally, until this thread surfaced in this group, I was like the
fictitious

The 802.11b stuff on the market today is NOT a FHSS system. It's
DSSS ... the FHSS option of the original standard never really made
it because .11b came along with so much better performance that
the other stuff just died off before it ever even got much of a start.

Thus, there is no "hop sequence" ...

However,
> unless it is stated that only a subset is used, I do assume that a
SS signal
> may hop onto any frequency in its defined range.

With all due respect, you assume wrong ... a DSSS system COULD
use (spread over) the entire band by placing its (suppressed) carrier
in the middle and using a chipping rate that would spread it that
wide, but then there would be only 1 (RF) channel ... of course, if
the
data rate was low enough, one might get enough processing gain to
be able to do CDMA overlay and have multiple users, but not at the
data rates that today's LANs need to carry.

You seem to have some confusion about the characteristics of FHSS
vs. DSSS systems ... the ARRL publishes at least one reasonably
good tutorial book on the subject. One of the definitive references
on
the subject of SS is "Spread Spectrum Systems" by Dixon, published
by Wiley ... I recommend it highly for even the semi-serious student
of
SS.

That's fact but so what? I "camp" on one of the popular machines
myself. It's the club machine owned by a large, very active
neighborhood club so a specific collection of club members and others
hang out on that pair which is very predictable social behavior. I'm
not a member but as do many others I leave the audio down and mostly
just monitor on the side. When one of the guys I'm close to shows up
we use the machine freely. I have never been hassled about any aspect
of those ops. I don't see anything wrong with any of it.

The repeater wars are a relic from the days before coordination, there hasn't been a good 'ole fashioned repeater war around here for decades. There are predictable verbal brawls between idiots and groups of idiots on some machines but those are no worse than their HF equivalents.
>
>
> All I'm saying is that dynamically allocated use of

With 98% of the 2m band dead spectrum space at an average point in time we're gonna move into trunking with it's monstrous infrastructure? Right. I should live so long . .
>
>
I have a little secret I'll share with you Squiggy: I can come up with my own 100% "private channel" on 2m any time I want one. Done it any number of times gong back to tube radio days. The scenario goes something like "Hey Jon, let's get off the machine and run simplex on 147.xxx." and off we go. Yeah, SIMPLEX, no machine, wash my mouf. Lost art. No stupid roger beeps or timeouts either and we only occupy one freq, not a pair.
>
>
Current 2m bandplan provides 830 Khz of open space for 2m simplex ops if you stretch the intentions of the bandplan a bit wrt respect to the 144.900-145.100 segment and stay away from the packet stations which lurk there. All of which I might metion are simplex operations. That 830 Khz is 230% the size of the entire twenty-meter band. 10 Khz spacing between channels works fine in most cases. What's my point you say? The opportunity to conduct 75 or more simultaneous private non-iterfering qsos in only 21% of the 2m band is my point. Without any changes in the regs or current off-the-shelf "technology" and with ZERO infrastructure including a repeater.
>
>
I've done all day all nite simplex comms on 2m. Couple three four guys agree to a freq and land on it, it's like a hardwired office-to-office intercom. Ya park the radio on the freq, squelch out the noise and go about the rest of yer life. Randomly toss out a question or comment, somebody in the group comes back. Otherwise absolute dead silence for hours and even days on end.

>

> obviously, because of the requirements of Part 97, run with the
> encryption turned off.

not that having encryption turned on is an insurmountable deterrent, in any case. the crypto used by 802.11b is weak and has been beaten by at least two independent academic teams. I would be surprised if there _wasn't_ a sniffer tool floating around now.

> (but don't get me started on how I think the blanket prohibition on
> encryption is unnecessarily stringent, that's a whole 'nuther subject
> that I'd rather not get started on now :-)

I'd like to go there, as I've been thinking about this recently. I wonder if authentication would be permissible? it seems like cryptographically secure authentication would fall under the provisions for tele-operation in the R&R. having to announce your callsign is more or less a low-tech way of doing it. authentication seems like it'd accomplish the same thing while still leaving the packets sniffable to eavesdroppers^Wother listeners.

how do packet mailboxes work? obviously you don't want some yahoo deleting all your mail, but what's to stop them from posing as you, reading it all, then deleting it? or hijacking your communication and sending delete commands as you're reading your mail? even if no malice, wrongdoing, or ill will is intented?

>One wonders if somewhere in the Army logistics snake, there aren't a whole
>bunch of McClellan saddles ready and able to make 'blisterbutts' of our
>troops once again.

Excuse me, but sophisticated, snarly mentions of KIPLING works are missing from this remark. Please revise and repost with the appropriate quoting from an author who was never in any military anywhere but picked up all his Brit army lore in bars and cafes.

In fact, you have stated you have not served in any military anywhere. Several in here HAVE, including argementers on both sides of the code issue. Are you going to manufacture a whole new thread and rail against the Army in ex-hippie style? If so, take it to another dimension since slamming the military is not de rigeur these days.

If you wish, you can FIND OUT whether saddles exist or not. It will take some searching, so get Arnie to help you out there. No doubt he might find some mention of it in Special Forces training. :-) Considering that U.S. Army Cavalry was ARMOR (read "very heavy vehicles" emitting noxious exhaust fumes) in my time, those saddles, if they existed then, are mighty dry now. :-)

I'm sure you can make some wonderful acerbic postings about all of the above, quote Kipling and other authors. It wouldn't hurt you to find out something of modern-day military communications would it? It's out there. How about Harris Corporations' "Falcon II" SDR that goes 1.6 to 512 MHz? Data, voice, encryption, the works in a man-pack to vehicular family. Tsk, tsk, not a morsekey in it.

Sorry you had to manufacture an argument that never existed.
I had high hopes that you might become civil and rational in here
but you are still covertly libeling those who have climbed on you
in the past. Tsk, tsk, tsk.

Not that it matters, but as far as I knew, the last permanent horse
unit in the U.S. Army was in D.C. and used for ceremonial
purposes...such as funeral processions.

I've mentioned in here that the U.S. mounted cavalry was the
first to use "horse mobile" radio on horseback. You can find
reference to it on the web with some looking. You must info-shop
on the web because you've sure as hell not gone out to observe
a modern-day Signal Battalion or Regiment in the field...or maybe
you did and got pissed that they weren't using CW? :-)

>
>I'll bet the special forces are capable of monitoring any CW
>used by the other side.

Doesn't matter if they are capable or not, Cecil. In the land forces of the US, Electronic Intelligence (ELINT, passive interception) is the province of the M.I., Military Intelligence. In the U.S. Army Fort Huachuca is the training center for M.I. UAV operations are learned there as well as morsemodes. :-)

What "CW used by the other side?" Who has evidence of any kind that the Taliban did communications by any kind of OOK?

If you wait a bit of time until the Afghanistan fracas has simmered down, read the resulting historical data such as might be posted by NSA or other Intelligence community, you would find out exactly what, whom, and how many were communicating on "the other side" (assumed meaning Taliban in Afghanistan). Here's a clue: It wasn't CW and the Taliban weren't using surplus AN/GRC-9s. :-)

By the way, Afghanistan was being monitored for several years, ever since the USSR gave up the place and the Taliban took over. Special Forces weren't doing it, Special Operations weren't doing it, Rangers weren't doing it, SEALS weren't doing it. Plain old ordinary unglamorous M.I. folkses were doing it. Newsies don't like that because it robs stories of "glamour" and "excitement!" :-)

Heck, it took me about six months to get you to admit that SF even required their troops to know Morse. I *never* said it was vital to their operations, I said it was required of the Communications Specialists. Quote *any* post I've ever written that states that Morse was VITAL to modern military operations (go ahead, I dare ya) You just continue to make it up as you go trying to fit those round thoughts into a square hole. Nothing has changed with you. BTW -- SF would *never* be in *monitor* mode as they are totally dependent on MI for intel, right?

Feel free to use the argument that I was never in military service or had direct contact with SF. That seems to be a favorite with you. Oops, can't use either one of those -- too bad.

I don't think that manufacturers should be required to print their entire specification on the box. Sooner or later, we have to assume some personal responsibility and learn a bit about the products we want to buy and use, especially if we want to use them in the ham bands. The box on my unit does say IEEE 802.11b, and a quick web search will turn up reams of information the b addition to the 802.11 standard.

>>I just don't get where you got the idea that DSSS devices, of
>>necessity, used the entire ISM band at once ...

>Of course not - that would be "wide band," not spread spectrum.

Spread spectrum COULD hop or spread over the entire 2.4 GHz ISM band. Why do you feel that a relatively narrow spread (20 MHz) is spread spectrum, but going to an 85.5 MHz spread (if I recall the ISM band width correctly) would not be spread spectrum?

> However, unless it is stated that only a subset is used, I do assume that a
SS
> signal may hop onto any frequency in its defined range.

But you just said that you didn't think that a device that did so would be spread spectrum. ???

>Again, a non-evident user choice.

Not to those that learn about a product from reading detailed information about it instead of expecting that the marketing information on the box tells them everything they need to know about the product.

Again, there is a lot of free information about spread spectrum and the IEEE 802.11 specifications.

>environment in which they must operate.

By the discussions by various WISPs on the ISP-wireless email reflector, interference is a pretty common problem. The majority are from Part-15 devices interfering with each other. The process gain used in most Part 15 devices is just enough to meet the FCC regs that allow them to run higher power instead of being limited to the much lower power of the general radiated emissions limits for intentional radiators.

The box on most transceivers indicate that the unit operates over a certain
frequency range. I do not expect that it uses all of those frequencies
simultaneously. It simply is not possible to reproduce the entire 802.11b spec'
on the box of a product.

If the S25.5 requirement is dropped, Carl, there is probably plenty that could and should be changed in the license structure. Just as one example, it would then make no sense to limit the first tier of license class to VHF only. Either a 3-class system that had a first tier limited by power, or by subsets of each band, or a 2- or even 1-class system might make more sense. The VHF/HF, no-code/code distinction was only to comply with S25.5.

>up so they can talk to him."

I didn't miss the point at all, Carl, but I may not have chosen the best words for my post. Even in a system that dynamically allocated frequency for a specific use, the information channel could remain transparent to the user. So if one accessed the information channel named "Local Club," Joe would still be there. Joe might not know exactly what frequency in the band his hardware was using, but he would still be able to find all of his buddies just as easily as he can right now.

The difference is that every single ham who wanted access to a similar channel in that band could have it, limited only by the fact that only N number of people could use that band *at the same time.*

Yes, but that didn't stop you from posting that the changes were never
publicized...

>What TAPR says is unimportant. Too many people have placed so much
>artificial
>importance in that group, their statements on anything are effectively
>worthless. A TAPR endorsement of anything is basically detrimental.

Not to most hams with a digital interest. I have learned quite a bit about
digital radio from the http://www.tapr.org web site.

>But as Ed Hare noted, these devices usually DON'T say so on the box, but
>simply
>say something like, "Frequency range: 2400-2483.5" even if they only choose
>a
>20MHz window in that range. Are we supposed to GUESS?

No, but guessing is exactly what you did when you posted all sorts of
mis-information about their operation.

>>> Then why do manufacturers publish their ranges in feet.

I know that the IEEE 802.11b devices I bought to play with in the lab came with
a very small dielectric antenna mounted on the PC board. They are often used in
environments that will be subject to all sorts of scatter. Having done a bit
more research than reading the box, I knew that they would operate with about
20 milliwatts or so -- a power level capable of much more range than "feet."

>Isn't all the 2.4 wireless lan stuff (since it must meet part 15) "products
>optimized for that market space"?

The wireless LAN stuff is generally more expensive and operates at higher power
and usually uses higher-gain antennas. The ISP-wireless list often talks about
ranges of tens of miles.

>Now, that someone has finally said that it is possible to use WITHOUT
>MODIFICATION (because what the manufacturers publish on their packaging is
>misleading and/or just plain wrong), that makes a difference.

Someone "finally" said that a few years ago. The "finally" here is that you "finally" read it.

The misleading and wrong I have seen has not been on the box. It has been in your posts and assumptions about how the products work.

>IMHO, if the subscription to QST were separable from
>membership, many would opt for the subscription only option.

Not many at all, Carl. If many members chose not to receive QST, dues would have to be increased significantly, or the things that ARRL did would have to be scaled back significantly, to make up for the lost revenues from advertising. When ARRL dues go up a dollar, there are a few thousand members who quit in outrage. Imagine the effect of seeing the dues almost double.

For many hams, especially newcomers, those QST articles are a good way of keeping track of some of what is happening in ham radio. In today's age, the www also lets them do that to some extent, but I enjoy some of the articles in QST nearly every month. :-)

I could care less about the HF frequencies..... everything I have heard on the HF frequencies is either "CQ Contest" or the usual CB crap on 14.313 and so on. I have been so turned off by the "mature" level of operators, these people being the ones who had to go to their testing session bare foot in 3 feet of snow up hill both ways to the exam, who are acting just like those who acuse others of being CB'ers.

Approximately 95% of my operation right now entails public service related transmissions. Getting involved in nets also would fit into that category. Public service and emergency communications is the main reason why I got into amateur radio in the first place. The other 5% is the occaisional contact made via simplex or repeater, and that usually winds up transferring to a conversation on the phone anyways.

Thanks for the support and maybe if I ever get enough time off from my jobs, I will definitely be doing some travel. How's about a cup of coffee on me? :)

Ryan

What is the need to "cash" those in? I only did it to satisfy me. HF has
no interest to me.
Just did it to prove something to myself. The comment in the quoted text
was sarcasm, you fool.

Grow up, get a life idiot.

>now?

Let's presume for a moment that it's late 2003 and the FCC has simply
dumped Element 1, but made no other changes.

Here's what's wrong:

- New hams have to pass the 35 question Tech written - but to do so, they
are handed the "200 page book", as W1RFI so often mentions. What Techs
get for their effort is ALL VHF/UHF at 1.5 kW power, but extremely limited
HF/MF.
Only tiny slices of four bands, and only two modes! I think the "entry level"
license
should allow more spectrum and modes but less power. Remember, RF safety was
not a concern back when the structure was created.

-The additional modes and spectrum granted upon upgrade do not match the
additional knowledge gained. For example, a Tech can use any authorized
mode at full power on 50-54 MHz, but not 28-29.7 MHz. Except for some
regulations and propagation knowledge, why is another test needed for
HF/MF?

-The tests are too full of minor regulations and too little weighted with
safety and
real theory questions. This is particularly true of the Extra.

-The license structure tends to push new hams into starting off on VHF/UHF
rather than HF/MF. That's a good thing, because it introduces them to
local amateur radio, but a not-so-good-thing because it limits their world-view
and tends to push them into using only manufactured rigs. (How many new hams
do you know who started out with homebuilt VHF/UHF rigs?)

- The existing structure is a patchwork job that dates back to over a
half-century ago.

--

What is YOUR vision for US amateur radio licensing beyond S25.5?

Glad you agree.

Nope. You mentioned it quite a ways back, then reiterated it here with the
above.
